# SECTION I

# INTRODUCTION

This Corrective Measures Implementation (CMI) Progress Report, Revision 1, for Contractor's Road Heavy Equipment (CRHE) Area Solid Waste Management Unit (SWMU) Number 055 was prepared by Geosyntec Consultants (Geosyntec) for the National Aeronautics and Space Administration (NASA) under contract number NNK09CA02B, Delivery Order NNK09CA62D and Project Number PCN ENV-2324. This CMI Progress Report documents: (i) activities conducted as part of supplemental assessment activities completed from June 2009 through November 2014; (ii) Engineering Evaluation (EE) Advanced Data Packages (ADPs); and (iii) recommendations for future activities related to corrective measures at the Site.

Applicable meeting minutes are provided as Appendix A. The following EE ADPs for CRHE are included with this CMI Progress Report:

- Supplemental Site Characterization ADP (Step 1 EE) (Appendix B)
- Site Characterization ADP (Step 1 EE) for Hot Spot 1 (HS1) (Appendix C)
- Remedial Alternatives Evaluation (Step 2 EE) ADP for HS1 (Appendix D)
- Interim Measures Work Plan (Step 3 EE) ADP for HS1 (Appendix E)
- Site Characterization ADP (Step 1 EE) ADP for Hot Spot 2 (HS2), High Concentration Plume (HCP), and Low Concentration Plume (LCP) (Appendix F)

A summary of direct-push technology (DPT) and groundwater monitoring well sampling results are provided in Appendices G and H, respectively. The Interim Land Use Control Implementation Plan (LUCIP) is provided as Appendix I. Monitoring well completion reports, other applicable field forms, survey data, and analytical laboratory reports are provided as Appendices J through M, respectively, in the electronic copy of this document. Selected Site photographs are provided in Appendix N. The interim groundwater monitoring plan and document revision log are included as Appendices O and P, respectively. KSC Electronic Data Deliverable (KEDD) files are provided on the attached compact disk.

# SECTION II

# SITE LOCATION AND BACKGROUND

## 2.1 SITE LOCATION AND OVERVIEW

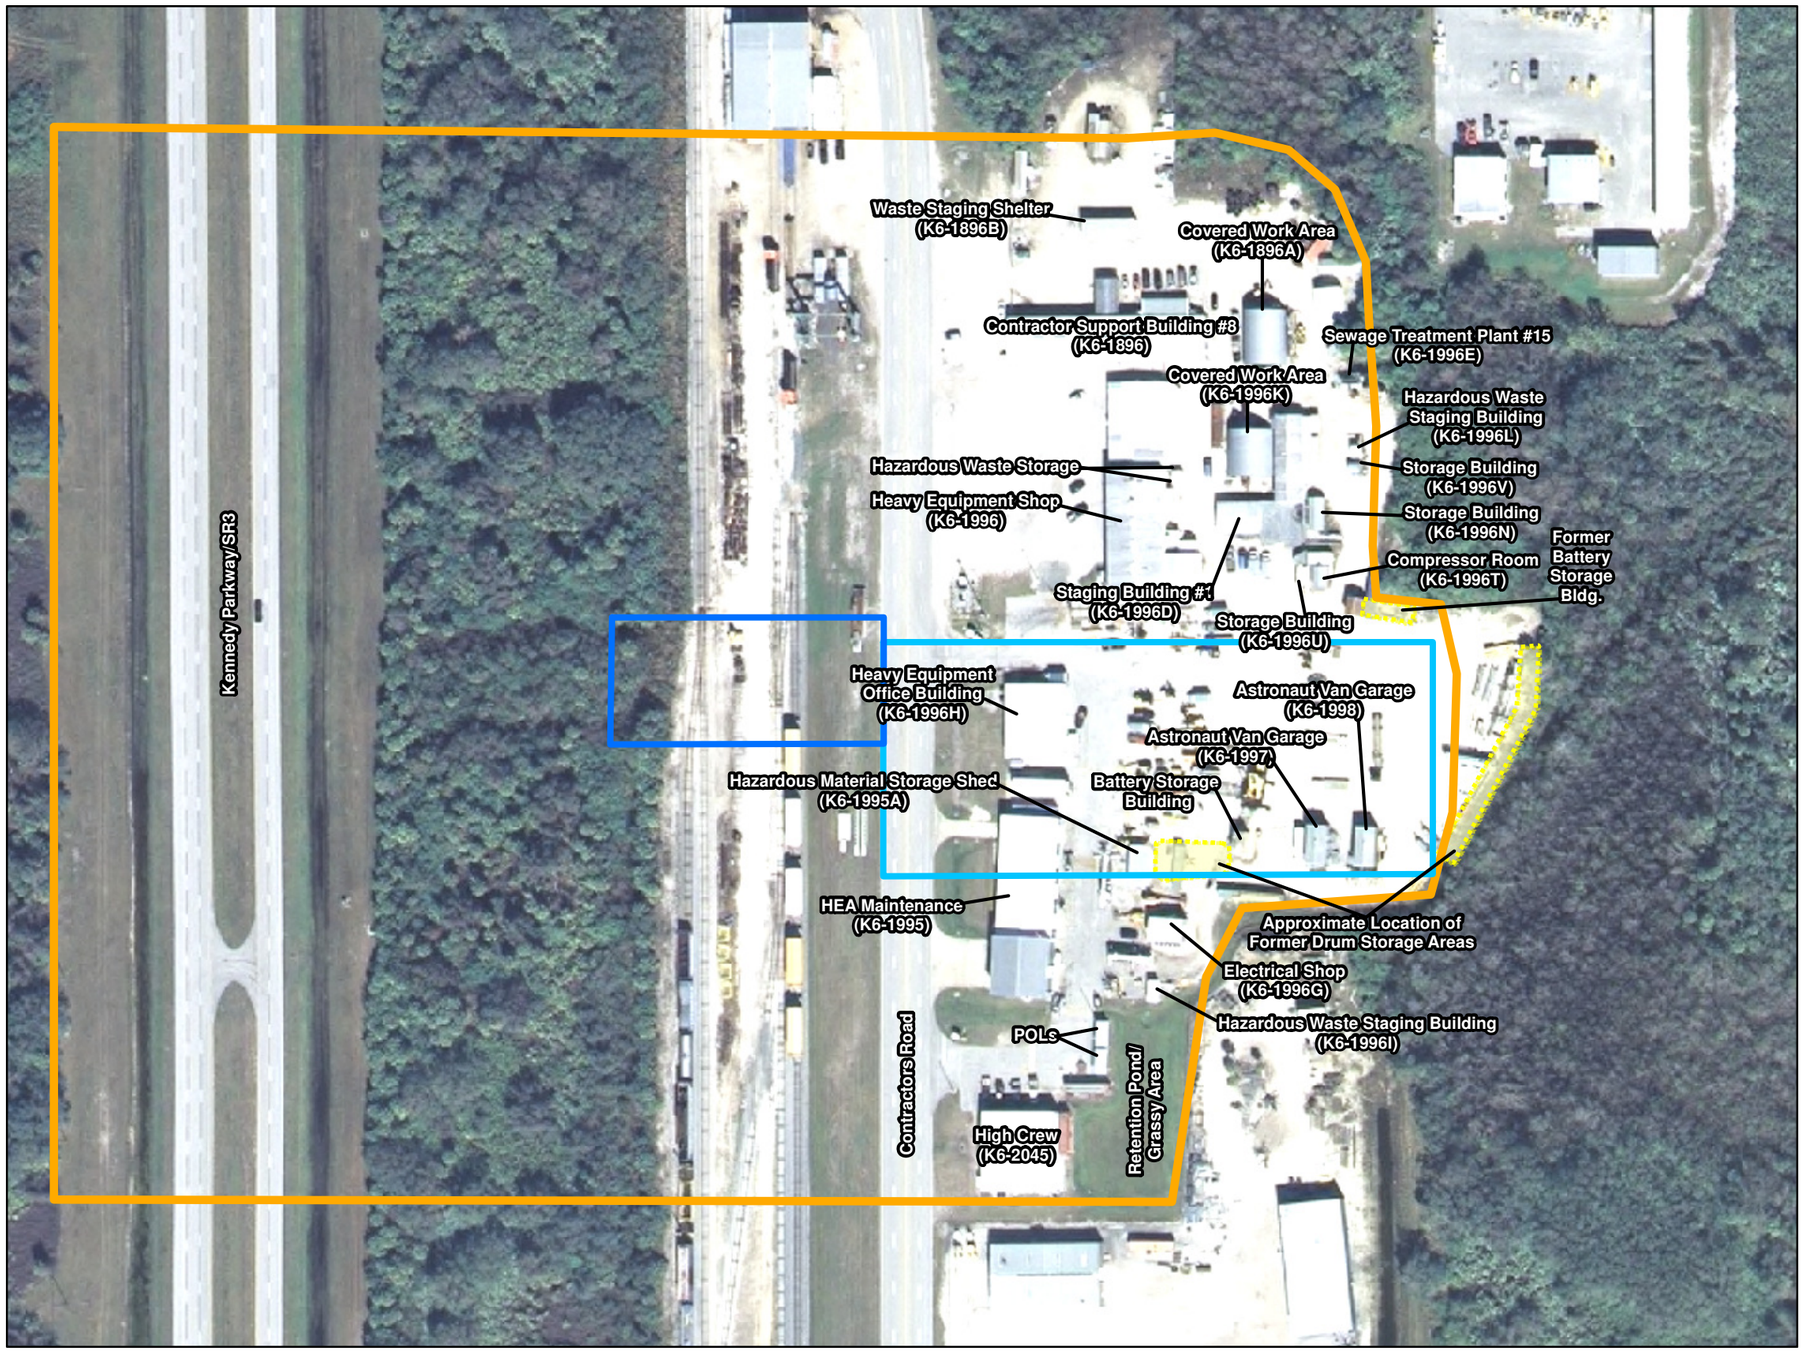
The CRHE Area is located at the John F. Kennedy Space Center (KSC), Florida, and includes SWMU Number 055 under KSC's Resource Conservation and Recovery Act (RCRA) Corrective Action program. The area encompassed by SWMU055 is approximately 23 acres in size and is located east of Highway 3 on either side of Contractor's Road approximately one-half mile north of Schwartz Road. The CRHE Area has been used for a variety of operations including heavy equipment storage and maintenance dating back to the construction of NASA's Vehicle Assembly Building (VAB), and for staging of regulated and hazardous waste. Currently, the CRHE Area is used for heavy equipment storage and maintenance; hazardous wastes are no longer stored on Site. The area consists of numbered buildings and support structures, including the Heavy Equipment Maintenance Shop (K6-1995), Hazardous Material Storage Shed (K6-1995A), Heavy Equipment Office Building (K6-1996H), Battery Storage Building (K6-1996M), and Astronaut Van Garages (K6-1997) (Figure 2-1). Portions of the Site are paved, but the majority of the Site is gravel or dense woods/wetlands. There are many underground utilities at the Site and thick road base in some areas to support the movement and storage of heavy equipment at the Site.

## 2.2 SITE BACKGROUND AND RCRA FACILITY INVESTIGATION SUMMARY

A RCRA Facility Investigation (RFI) was performed in the 1990s to characterize the nature and extent of environmental impacts through soil, sediment, surface water, and groundwater sampling. Volatile organic compounds (VOCs) were detected above regulatory screening criteria in nine of seventeen shallow and intermediate monitoring wells. Additional locations were selected for groundwater sampling using a Waterloo Profiler sampler driven by a DPT rig to further characterize the extent of VOC groundwater impacts. Based on DPT sampling results, four additional intermediate monitoring wells were installed resulting in a permanent well network consisting of 15 shallow monitoring wells, screened between 0.5 and 17 feet (ft) below land surface (BLS), and five intermediate monitoring wells, screened between 30 and 50 ft BLS. An approximate five acre plume was identified, with the highest concentrations observed between 15 and 45 ft BLS; however, no source area was identified. During these activities, some Site monitoring wells were sampled and analyzed for 1,4-dioxane. The results were non-detect with detection limits elevated over the Florida Department of Environmental Protection (FDEP) Groundwater Cleanup Target Level (GCTL).

In 2000, the Corrective Measure Study (CMS) Report concluded that chlorinated volatile organic compounds (CVOCs) were attenuating and the vinyl chloride (VC) GCTL would be met in approximately ten years, resulting in no recommendations for active corrective measures. The selected remedy was monitored natural attenuation (MNA) with groundwater monitoring, which was conducted from 2001 to 2008, with incorporation of the Site into the VAB long-term monitoring (LTM) program in 2005.

Increasing concentrations of cis-1,2-dichloroethene (cDCE) and VC were observed in CRHE-IW0019I from 2007 to 2009 and supplemental assessment activities were recommended to further evaluate the presence and source(s) of CVOCs in groundwater at the Site. In May 2010, the team approved discontinuing groundwater monitoring under the VAB LTM program at the Site until further assessment was completed.



Note: Historical Site Features were obtained from the 1999 RFI Report.

# SECTION III

# SUPPLEMENTAL ASSESSMENT ACTIVITIES

## 3.1 OVERVIEW

Supplemental assessment activities were conducted by Geosyntec from June 2009 through November 2014 to evaluate Site lithology and refine the delineation of the horizontal and vertical extents of the CVOC impacts to groundwater. Results of the supplemental assessment activities were presented to the Team in Step 1 ADPs presented during the June 2012, December 2013, and April 2015 Team Meetings which are provided in Appendices B, C, and F, respectively. The supplemental assessment included the following activities:

- Advancement of seven soil borings to an approximate maximum depth of 80 ft BLS to evaluate Site lithology.
- Collection of 2,338 DPT groundwater samples from 363 locations for mobile laboratory analysis of CVOCs (analytical results from DPT sampling are summarized in Appendix G).
- Collection of two membrane interface probe (MIP) profiles for subsurface detection of CVOCs and identification of the likely distribution of mass in the SZ.
- Installation and development of 18 new monitoring wells to augment the existing monitoring well network, including installation of CRHE-MW0040 (installed by others) to evaluate potential dragdown in the source area.
- Collection of three rounds of comprehensive water level measurements.
- Collection of groundwater samples from 25 monitoring wells during the 2012 groundwater sampling event and from monitoring well CRHE-MW0040 in July 2013 with laboratory analysis of the samples for CVOCs (analytical results from monitoring well sampling are summarized in Appendix H).
- Incorporation of groundwater assessment results into a comprehensive Site-wide Environmental Visualization Software (EVS) model to create isosurface contours and cross sections of CVOC impacts.

Monitoring well construction details are provided in Table 3-1 and the survey data and groundwater elevations are provided in Table 3-2. The monitoring well results for field water quality parameters are provided in Table 3-3.

## 3.2 SUMMARY OF SITE CONDITIONS

### 3.2.1 SITE LITHOLOGY

Lithologic conditions at the Site are generally consistent with conditions encountered at other KSC sites in the vicinity. The underlying lithology generally consists of: (i) medium sand and silty sand of varying color in the upper 8 to 10 ft BLS; (ii) fine to medium sand with shell from approximately 8 to 15 ft BLS; (iii) black and grey fine sand with increasing amounts of shell from approximately 15 to 50 ft BLS; (iv) grey silty sand with varying amounts of clay and shell from approximately 50 to approximately 77 ft BLS; and (v) fine silty sand with shell fragments from approximately 77 ft BLS to the maximum depth of penetration (80 to 82 ft BLS).

Overall, the lithology at the Site is primarily sand from ground surface to approximately 50 ft BLS, where the lithology transitions to a silty sand with varying amounts of clay. The silty sand with varying amounts of clay layer acts as a semi-confining layer beneath the Site. The lithology transition is based on visual observations, MIP results, and correlating DPT groundwater results.

### 3.2.2 SITE HYDROGEOLOGY

The permanent groundwater monitoring network for the Site is shown on Figure 3-1. Groundwater zones for this Site have been defined as follows: (i) shallow groundwater less than 15 ft BLS; (ii) intermediate groundwater from 25 to 50 ft BLS; and (iii) deep groundwater from 60 to 70 ft BLS. Water levels were collected in March 2012 and July 2013 to evaluate the groundwater flow in the shallow, intermediate, and deep groundwater zones at the Site.

Groundwater flow in the shallow zone (less than 15 ft BLS) was to the west in March 2012. Shallow groundwater flow has been influenced by wetlands that surround the Site to the north, east, and west; therefore, easterly shallow groundwater flow as seen in July 2013 is not unexpected. Shallow groundwater elevations varied from 0.27 to 0.98 ft BLS in March 2012 and from 2.96 to 1.94 ft BLS in August 2013. Groundwater flow in the intermediate zone (25 to 50 ft BLS) is generally to the west and southwest. The deep groundwater flow is toward the southwest (based on data from three monitoring wells). Groundwater flow velocity is estimated to be 28 ft/year in the shallow zone and 69 ft/year in the intermediate zone (based on specific capacity tests on shallow and intermediate wells during RFI).

The average horizontal groundwater gradient across the Site was estimated based on 2013 groundwater elevation data to be 0.015 ft/ft in the eastern shallow zone (based on well pair CRHE-IW0009S/CRHE-MW0024) and 0.001 ft/ft in the western shallow zone (based on well pair CRHE-IW0004S/CRHE-MW0030), 0.004 ft/ft for the intermediate zone (based on well pair CRHE-IW0004I/CRHE-MW0029), and 0.001 ft/ft for the deep zone (based on well pair CRHE-IW0014D/CRHE-MW0022).

### 3.2.3 SUMMARY OF SOIL CONDITIONS

As documented in FDEP's letter dated 25 February 2014, there are no identified soil issues and no further actions associated with soil at the Site are required.

### 3.2.4 SUMMARY OF GROUNDWATER IMPACTS

High frequency DPT groundwater sampling was conducted with the objective of vertical and horizontal delineation of: (i) LCP (CVOC concentrations greater than GCTLs); (ii) HCP (CVOC concentrations greater than Natural Attenuation Default Criteria [NADC]); (iii) hot spots (HSs) (CVOC concentrations greater than 10xNADCs); and (iv) the source zone (SZ) (approximate 1% TCE solubility or TCE concentrations greater than 11,000 micrograms per liter [µg/L]). Groundwater sampling activities completed to date delineated a site-wide LCP, separate HCPs in the northern and southern portions of the Site, and two HSs in the southern portion of the Site (Figure 3-2). Based on results from assessment activities conducted to date, impacts to the Site groundwater consist primarily of TCE, cDCE, and VC. The only other constituent detected at a concentration above its GCTL during supplemental assessment activities was 1,1-dichlorothene (1,1-DCE).

The LCP covers approximately 15 acres and extends from the eastern side of operational facilities along Contractor's Road to the western side of Kennedy Parkway. Groundwater impacts in the LCP are present from approximately 8 to 70 ft BLS.

The northern HCP is approximately one and a half acres and the southern HCP is approximately three acres for a combined area of approximately four and a half acres. CVOC impacts in the northern HCP are present from approximately 26 to 65 ft BLS and in the southern HCP from approximately 8 to 60 ft BLS. Maximum CVOC concentrations in groundwater samples from the northern HCP were: cDCE at 2,100 µg/L in DPT0036; and VC at 910 µg/L in DPT0036. TCE was not detected above laboratory reporting limits in the northern HCP. Maximum CVOC concentrations in groundwater samples from the southern HCP were: TCE at 3,000 µg/L in DPT0092; cDCE at 6,900 µg/L in DPT0211; and VC at 1,000 µg/L in DPT0220.

HS1, which encompasses approximately three acres, was defined to incorporate the identified TCE SZ. CVOC impacts are present from 8 to 50 ft BLS; however, the contaminant mass is concentrated from 36 to 40 ft BLS. MIP results correlate well with DPT groundwater data and observed Site lithology. Maximum concentrations observed in DPT groundwater samples collected from the HS1 area included TCE at 160,000 µg/L in DPT072, cDCE at 110,000 µg/L in DPT200, and VC at 19,000 µg/L in DPT200. CRHE-MW0040 was installed in the SZ (co-located with DPT072) to evaluate potential dragdown in this area and the non-detect results for VOCs confirmed the vertical delineation within the SZ. Within the HS1 area, the area with TCE

SZ concentrations covers 0.06 acres, the area with concentrations greater than 10xNADC (i.e., HS) is 0.43 acres, the area with concentrations greater than NADC (i.e., HCP) covers 0.78 acres, and the area with concentrations greater than GCTLs (i.e., LCP) covers 1.99 acres.

HS2 (cDCE and VC concentrations above 10xNADC), which covers approximately 0.5 acres, is also shown on Figure 3-2 and was defined as the area of cDCE and VC concentrations outside of HS1 exceeding 10xNADC. HS2 has CVOC impacts from 31 to 55 ft BLS, with the majority of the mass in the 31 to 45 ft BLS interval. The maximum DPT groundwater concentrations observed within the HS2 area include TCE at 3,400 µg/L in DPT0139, cDCE at 9,900 µg/L in DPT0231, and VC at 4,500 µg/L in DPT0271.

# SECTION IV

# OVERVIEW OF ENGINEERING EVALUATIONS

## 4.1 SUPPLEMENTAL SITE CHARACTERIZATION

Supplemental site assessment activities conducted across the Site were presented during the June 2012 KSCRT Meeting (Appendix B). Groundwater impacts were identified between 8 and 50 ft BLS with the maximum concentrations at 36 to 40 ft BLS. Separate HCPs were identified in the northern and southern portions of the Site. A TCE SZ was identified in the southern HCP. Additional DPT sampling was recommended to address sample location spacing and data gaps Site-wide and in the SZ. Team consensus was reached during the June 2012 Team Meeting to proceed with DPT groundwater sampling to fill data gaps.

## 4.2 SITE CHARACTERIZATION OF HOT SPOT 1

Site characterization of HS1 was presented during the December 2013 KSCRT Meeting (Appendix C). Team consensus was reached that delineation was complete within HS1 for the following areas: (i) source zone (TCE greater than 11,000 µg/L); (ii) TCE and cDCE greater than 10xNADC; (iii) TCE greater than NADC; and (iv) TCE greater than GCTL. Team consensus was also reached that: (i) cDCE HCP and LCP plumes are co-mingled with adjacent HS areas and that delineation within HS1 is complete; and (ii) VC HCP and LCP plumes are co-mingled with adjacent HS areas and that delineation within HS1 is complete. Additional delineation was specified as ongoing for the LCP, HCP and HS2.

A summary of site conditions that will potentially affect the remedial technology selection and design was also presented and included the presence of buildings and site structures, the high level of activity at the Site, the downgradient edge of the 10xNADC plume extending under a building, and the presence of thick road base in some areas. A remedial technology screening summary was presented for the SZ and HS1. Engineering data gap sampling was proposed for four wells down the plume centerline and across the Site with analysis of dissolved gases, sulfate, sulfide, *Dehalococcoides*, *VC Reductase*, VOCs, and 1,4-dioxane. Team consensus was also reached to proceed with the Remedial Alternatives Evaluation for HS1.

## 4.3 REMEDIAL ALTERNATIVES EVALUATION FOR HOT SPOT 1

A remedial alternatives evaluation (Step 2 EE) for HS1 was presented during the February 2014 KSCRT Meeting (Appendix D). During this presentation, preliminary designs for remedial technologies used to treat either the source zone or the 10xNADC plume were presented. The technologies evaluated for source zone (TCE concentrations > 1% solubility) remediation included: (i) air sparge and soil vapor extraction (SVE); (ii) bioremediation using emulsified oil;

and (iii) injection of emulsified zero-valent iron (EZVI). The technologies evaluated for 10xNADC plume remediation included: (i) air sparge and soil vapor extraction; (ii) bioremediation using emulsified oil with groundwater recirculation and passive venting beneath the building present above the 10xNADC plume; and (iii) injection of EZVI within the source zone and bioremediation using emulsified oil within the 10xNADC plume with groundwater recirculation and passive venting beneath the building present above the 10xNADC plume. Team consensus was reached to proceed with a bioremediation design within the source zone area.

## 4.4 INTERIM MEASURES WORK PLAN FOR HOT SPOT 1

An interim measures work plan for HS1 was presented during the May 2014 KSCRT Meeting (Appendix E). During this presentation, a design for the bioremediation of the source zone area was presented. The design called for the injection of approximately 71 drums of emulsified vegetable oil (SRS®-SD was used for the design), diluted to a 1:80 ratio with anaerobic water, at 29 locations of varying depth intervals (14 to 50 ft BLS), as well as the installation of eight monitoring wells. Team consensus was reached on the initial design with minor revisions to the following: (i) modifying language regarding vendors so that any vendor can be used; (ii) clarifying that injection locations will be grouted; (iii) increasing monitoring well pad size and reinforcement; (iv) including specific monitoring wells for mounding monitoring during injection activities; (v) removing the Step 4B EE from cost estimates; and (vi) providing coordinates for DPT injection locations.

## 4.5 SITE CHARACTERIZATION OF HOT SPOT 2, HIGH CONCENTRATION PLUME, & LOW CONCENTRATION PLUME

Site-wide characterization (including HS2, HCP and LCP) was presented during the April 2015 KSCRT Meeting (Appendix F). Team consensus was reached that delineation was complete for the following areas: (i) TCE, cDCE, and VC within HS2; (ii) TCE, cDCE, and VC greater than NADC; and (iii) TCE, cDCE, and VC greater than GCTL.

A summary of site conditions that may affect remedial technology selection and design was also presented and included the presence of wetlands, railroads, a drainage ditch, roadways, buildings and site structures, the high level of activity at the Site, the downgradient edge of the 10xNADC plume extending under a building, and the presence of thick road base in some areas. A remedial technology screening summary was presented for HS2 and HCP. Team consensus was reached to proceed with a Step 2 EE of the retained remedial technologies.

The interim groundwater monitoring plan was also presented during the April 2015 KSCRT Meeting. Team consensus was reached to install two supplemental monitoring wells and sample select existing monitoring wells on an annual basis (Appendix O).

# SECTION V

# RECOMMENDATIONS

Remedial technologies to be evaluated during the Step 2 for HS2, HCP, and LCP include: (i) bioremediation (with the option for recirculation) and air sparging in HS2 and HCP; and (ii) monitored natural attenuation for LCP.

The interim groundwater monitoring plan, presented during the April 2015 KSCRT meeting, includes annual sampling of select Site monitoring wells.

# APPENDIX A

# APPLICABLE REMEDIATION TEAM MEETING MINUTES

| | | |
|---|---|---|
| 1206-M14 | Jill Johnson/ Geosyntec | Contractor's Road Heavy Equipment Area (SWMU 55)<br>**Goal**: Present Step 1A and proposed additional assessment<br>**Discussion**: Groundwater impacts were observed between 8 and 50 ft BLS with the maximum concentrations at 36 to 40 ft BLS. There are separate high concentration plumes identified on the northern and southern portions of the site. A TCE source zone was identified in the southern portion of the site. Additional DPT sampling is proposed to address sample location spacing concerns as well as data gaps. Path forward following additional sampling efforts will be to supplemental sampling results and Step 1B. Team consensus reached on proposed DPT locations as presented at the June 2012 team meeting.<br>**Results**: Decision item 1206-D31 |

| | | |
|---|---|---|
| 1312-M02 | Jill Johnson/ Geosyntec | Contractor's Road Heavy Equipment Area (SWMU 055)<br>**Goal:** Present Step 1 Engineering Evaluation<br>**Discussion:** Focus of presentation is Hot Spot 1 (HS1), which is approximately 3 acres in size. In June 2012, Step 1 EE for the entire site was presented to the Team. Additional sampling was recommended. Additional delineation is ongoing for the LCP, HCP and Hot Spot 2.<br>HS1 supplemental assessment activities included one MIP profile, 745 DPT groundwater samples from 94 locations, water level measurements, lithology borings, and monitoring well installation and sampling (deep well for vertical delineation).<br><br>The lithology at the site is generally sand with shell hash from approximately 15 to 45 or 50 ft BLS and a silty sand with clay at approximately 50 ft BLS.<br><br>The groundwater flow maps were revised and provided to the Team. Groundwater flow in the shallow zone (less than 15 ft BLS) is variable and influenced by the wetlands that surround the site to the north, west, and east. The groundwater flow in the intermediate zone (25 to 50 ft BLS) is generally to the west and southwest. The deep groundwater flow is towards the southwest, but only based on three monitoring wells. Groundwater flow velocity in the intermediate zone is approximately 69 ft/yr.<br><br>MIP results show that the main interval of groundwater impacts are from 35 to 45 ft BLS, which correlate with the DPT groundwater data.<br><br>In HS1 the source zone is defined as 11,000 ppb because this represents the area where DNAPL could be present. Impacts are generally from 8 to 50 ft BLS. The source zone contaminant mass is mainly 30 to 46 ft BLS. Monitoring well MW40 provides delineation vertically.<br><br>Mass estimates revised for the presentation to include hand calculations and EVS calculations showed that a large range of mass could be present at the site (total CVOC mass range of 27 to 223 lbs). Within HS1, the source zone is 0.4 acres and represents 4 to 12% of mass. |

Team consensus reached that delineation is complete within HS1 for the following: (i) the source zone (TCE greater than 11,000 ppb), (ii) TCE and cDCE greater than 10x NADC, (iii) TCE greater than NADC; and (iv) TCE greater than GCTL. Mike is uncomfortable with the delineation around the building, the utility corridor and area where the thicker road base is and sees this as a data gap.

Team consensus reached that the 1% solubility of TCE is the source zone (SZ).

Team consensus reached that in the SZ technologies to be evaluated include EZVI, bioremediation and air sparging/SVE and that in the CVOC 10X NADC area technologies to be evaluated include EZVI (1% solubility) with bioremediation in the remaining area within 10X NADC, bioremediation, and air sparge/SVE.

**Results**: Decision items 1312-D04 through D06

| | | |
|---|---|---|
| 1402-M06 | Rebecca Daprato/ Geosyntec | Contractor's Road Heavy Equipment Area (SWMU 55)<br>**Goal**: Present EE Step 2 and obtain team consensus on treatment area (Overall 10X NADC or Source Zone) and technology for Interim Measures.<br>**Discussion**: Impacts in Hot Spot 1 are generally from 8 to 50 ft BLS, with maximum concentrations of TCE of 160,000 µg/L (DPT0072 36 to 40 ft BLS), cDCE of 110,000 µg/L (DPT0200 26 to 30 ft BLS), and VC of 19,000 µg/L (DPT0200 31 to 35 ft BLS). The Step 1 EE defined the source zone as the area with TCE greater than 1% solubility (11,000 µg/L). Source zone contaminant mass is mainly 30 to 46 ft BLS, with 60% of the mass in this zone. The inferred source zone contour, as presented in this ADP creates a single, more conservative source zone which was used for evaluation of treatment alternatives in consideration of likely subsurface distribution outside of the identified locations. The 10xNADC plume encompasses the area with TCE, cDCE, and VC greater than 10xNADC. Based on the geochemical parameters, there is strong evidence that biologically mediated reductive dechlorination is occurring at the site. The results of the sampling for 1,4-dioxane indicate that 1,4-dioxane is not an issue for remedial decision making. However, this parameter will be included in the future monitoring program.<br><br>Supplemental DPT groundwater sampling will be performed in 2014 as part of HCP and LCP delineation. Samples will be collected from under the Heavy Equipment Office Building and from within the roadway (Contractor's Road). This data will be incorporated into design (IM design report or the implementation work plan).<br><br>The Hot Spot 1 corrective action objective is to reduce CVOC concentrations within the treatment area to less than NADCs. NASA may elect to continue IM to GCTLs and/or some alternative asymptotic level based upon performance. The CAO for the site was discussed and reducing concentrations to NADC may not be the goal for the treatment area (1% TCE solubility or 10XNADC), since there are concentrations outside the treatment area above NADC. The CAO will be revised in the Step 3. |

Alternative 1A Air Sparge and SVE source zone: Installation of 13 air sparge (AS) wells via hollow stem auger. AS wells screened from approximately 48 to 50 ft BLS with spacing between wells of approximately 20 feet, with an approximate 20 ft ROI. 25-hp AS system operating one of two zones at a time. The alternative assumed use of mobile air sparge trailer #3 (conservative 25 hp compressor), capable of 190 scfm and 31.0 psi. Electric is available onsite from transformer located north of Heavy Equipment Office Building. Installation 11 SVE chambers to capture vapors in treatment area. Purchase of an SVE system (10-hp) with GAC treatment of recovered vapors. This alternative includes 3 days of DPT groundwater sampling to evaluate system optimization or shut down. O&M will be conducted daily for first three days, weekly first month, monthly thereafter. Performance monitoring would consist of installation of 10 monitoring wells sampled quarterly for VOC analysis. Ambient air sampling program will be implemented, if AS/SVE is selected and implemented. A detailed description of the air sampling plan will be provided in the Step 3. Associated costs are minimal and are considered to be included in the O&M cost provided. The estimated time to achieve CAO is 2 to 3 years, with a total cost estimated at $465,000 to $561,000. Cost assumes the use of an existing mobile air sparge trailer.

Alternative 1B Air Sparge and SVE 10xNADC plume: Installation of 34 AS wells via hollow stem auger. AS wells screened from approximately 48 to 50 ft BLS. Five angle-drilled AS wells to be installed beneath Heavy Equipment Office Building. AS wells in the source zone and under the building were spaced at approximately 20 ft. In the 10XNADC ring, AS well spacing was approximately 30 feet. A 20 ft ROI is assumed. Use of mobile air sparge trailer #3 is assumed (conservative 25 hp compressor), capable of 190 scfm and 31.0 psi. Electric is available onsite from transformer located north of Heavy Equipment Office Building. Installation of 16 SVE chambers to capture vapors in treatment area. Purchase of an SVE system (10-hp) with GAC treatment of recovered vapors. Due to the utility corridor, hand augering to the water table will be required for well installation and hand digging for trenching. Included 5 days of DPT groundwater sampling to evaluate system optimization or shut down. O&M will be conducted

daily for first three days, weekly first month, monthly thereafter. Performance monitoring would consist of installation of 15 monitoring wells sampled quarterly for VOC analysis. The estimated time to achieve CAO is 2 to 3 years, with a total cost estimated at $699,000 to $821,000. Cost assumes the use of an existing mobile air sparge trailer and purchase of trailer-mounted SVE system.

Alternative 2A Bioremediation Source Zone: 29 DPT Injection points with electron donor injected from 20 to 50 ft BLS, with injection point spacing based on an 8 ft ROI. Injection of 33 drums of emulsified oil assumed, based on filling 0.5% pore volume with emulsified oil (conservative estimate based on possibility of DNAPL). Second injection (17 drums) of emulsified oil 24 months after initial event, based on filling 0.25% of pore volume with emulsified oil. Plan includes 3 days of DPT sampling to aid in design for second injection event. Performance monitoring consists of installing 10 wells to be sampled for VOCs quarterly, analyzing a subset of 5 wells for *Dhc, vcrA*, sulfate, sulfide, and TOC. The estimated time to achieve CAO is 3 to 5 years, with a total cost estimated at $437,000 to $557,000. The time to achieve the CAO was estimated using dechlorination rates from MLP/VAB Area biostimulation.

Alternative 2B Bioremediation 10XNADC plume: 107 DPT injection points with electron donor injected from 20 to 50 ft BLS, with spacing based on 8 ft ROI. There will be six angle-drilled injection points beneath the building. Intend to use solar-powered groundwater recirculation system to distribute amendment beneath the building. Passive vents will be installed to avoid methane accumulation beneath the building. Injection of 102 drums of emulsified oil is assumed. Includes 5 days of DPT sampling to aid in design for second injection event. Second emulsified oil injection 24 months after initial event; assumed to be 35 drums. In the second event, the source zone dosage is assumed to be 50% of the original dose into all original locations. In the 10XNADC area, a 50% dosage into half of the original locations is assumed. Performance monitoring consists of installation of 15 wells VOC sampling quarterly, analyzing a subset of 8 wells for *Dhc*, *vcrA*, sulfate, sulfide, and TOC, and sampling the injection and extraction

wells to aid in evaluation of mass removal under building. The estimated time to achieve CAO is 3 to 5 years, with a total cost estimated at $930,000 to $1,129,000.

Alternative 3A EZVI Source Zone: Treatment interval is 20 to 50 ft BLS. Treatment consists of 126 DPT injection points, into which approximately 20,500 gallons EZVI (5% by weight) is assumed to be injected from 20 to 50 ft BLS. The injection point spacing is based on estimated 3 ft ROI. A second EZVI injection event is assumed to be conducted 24 months after initial event, consisting of 50% the initial injection volume - 10,250 gallons. Treatment plan includes 3 days of DPT sampling to aid in design of second injection event. Performance monitoring consists of installing 10 wells to be sampled quarterly for VOCs. The estimated time to achieve CAO is 3 to 5 years, with a total cost estimated at $1,240,000 to $1,340,000. The 3 ft ROI was discussed as being overly conservative. At other sites, a 6 ft ROI was assumed. The cost was revisited using a 6-ft ROI, and a total cost reduction of approximately $90,000 could be obtained by increasing ROI to 6 ft. Cost for EZVI is driven by the amount of EZVI needed and that does not change, when the ROI is increased. Drilling costs and associated field time are reduced.

Alternative 3B EZVI and Bioremediation with Recirculation 10xNADC plume: EZVI to be conducted in the Source Zone – same as Alternative 3A. Bioremediation in the 10xNADC will be conducted the same as described in the 10xNADC area in Alternative 2B. Plan includes 5 days of DPT sampling to aid in the design of the second injection event. Second injection expected to be 24 months after initial event, in which the SZ receives 50% of the initial injection volume, and the 10xNADC area receives 50% of the volume into half of the original locations. Performance monitoring consists of installing 15 wells that will be sampled quarterly for VOC analysis, analyzing a subset of 3 wells for *Dhc, vcrA*, sulfate, sulfide, and TOC, and sampling of injection and extraction wells to evaluate mass removal under building. The estimated time to achieve CAO is 3 to 5 years, with a total cost estimated at $1,718,000 to $1,883,000.

All three technologies are capable of treating COCs. Why not air sparging?

- Trenching at an active facility with large pieces of equipment and personnel that work in the area.
- Heavy equipment will likely require specialty vault boxes and geotech evaluation for trenching.
- Likely mounding from AS and possible entrainment issue with SVE.
- Scale up/expansion issues when looking at plume as a whole – due to presence of road/railroad yard and woods/wetland.
- Engineering solutions can be developed, but there are risks.

Why Bioremediation?

- Passive implementation
- Ideal geochemistry
- Reduced OM&M (monitoring only)
- Amenable to scaling
- Thought to be more cost-effective than EZVI, based on assumptions about dechlorination rates

AS/SVE is less expensive per pound and total "Pay as You Go", but bioremediation offers:

- A more passive technology at a busy site
- Reduced impact to operations
- Reduced risk of damage to utilities or to the treatment system during operation
- Reduced risk of failure – AS/SVE mounding likely to cause entrainment issues for SVE with potential exposure to personnel

There was a discussion about the treatment interval of 20 to 50 ft for bioremediation and EZVI. The treatment interval was set at 20 to 50 ft to be able to directly compare to air sparging, which will treat the entire interval. The treatment interval would be approximately 15 ft to treat the 10XNADC impacts, so the cost for bioremediation and EZVI would be reduced, if the treatment interval was reduced. The reduction in cost would be most significant for EZVI because would reduce the purchase of EZVI by half (cost reduction of approximately $350,000). It was noted that bioremediation, EZVI and

EZVI/bioremediation have beneficial indirect effects beyond the zone of treatment.

Team consensus reached on alternative 2A bioremediation of the Source Zone (TCE 1% solubility).

Step 3 EE will look into the treatment interval for alternative 2A.

**Results**: Decision item 1402-D20

1405-M10 Rebecca Daprato/ Geosyntec

Contractors Road Heavy Equipment Area (SWMU 055)
**Goal**: Present Step 3 EE and obtain team consensus on the bioremediation IM work plan.
**Discussion**: The objectives of the IM are: (i) to evaluate if bioremediation is effective in treating TCE concentrations that are greater than 1% solubility (probable dense non-aqueous phase liquid); and (ii) obtain data to evaluate the implementation of bioremediation in a larger treatment area.

The treatment area is the source zone where TCE concentrations are greater than 11,000 µg/Land the vertical treatment interval includes the interval with CVOCs greater than 10X NADC (approximately 15 to 50 ft BLS).

The bioremediation IM includes the DPT injection of 71 drums of SRS®-SD diluted 1:80 with potable water (injection intervals vary by location; interval injection rationale and dosing provided in ADP and IMWP). Semi-annual performance and UIC monitoring will be conducted using eight monitoring wells and a robust DPT groundwater sampling event will be conducted one to two years post-injection.

The implementation work plan should include a site layout/staging plan to provide locations where substrate, equipment, and tank staging are planned to be placed.

Based upon current site sampling results (presence of ethene and ethane and presence of *Dhc* and *vcrA*), microcosm testing is not necessary, since the sampling results indicate that complete reductive dechlorination is occurring. Agree that bioaugmentation would be beneficial, but is not necessary. Propose that the decision to bioaugment be made based on the

baseline sampling results. Groundwater samples will be analyzed for *Dhc* and *vcrA* from two proposed monitoring wells and if the *Dhc* and *vcrA* concentration is less than $10^6$ gene copies per liter, bioaugmentation will be performed.

SRS®-SD does not normally contain sodium bicarbonate, but it will be added by the manufacturer during the manufacturing process. The sodium bicarbonate will provide additional buffering capacity to the aquifer. There was no additional cost for the addition of sodium bicarbonate to the SRS®-SD. Per the FDEP Acceptance Letter provided in Appendix D of the IMWP, UIC monitoring associated with the injection of SRS®-SD requires monitoring of sodium, total dissolved solids, and total recoverable petroleum hydrocarbons. Since the UIC monitoring includes sodium, there should be no secondary UIC issues. Also, by approximating the resulting concentration of sodium in the 305,000 gallons of pore volume, the concentration of sodium in the aquifer due to the addition to 8 g/L of sodium bicarbonate to the SRS®-SD is less than 0.03 g/L, and the KSC Upper Range of Background for sodium is 15 g/L (FDEP GCTL is 0.16 g/L).

The changes made between the Step 2 and the Step 3 EE included the following: (i) modification of the electron donor from EOS® to SRS®-SD; (ii) increasing the dosing of the electron donor from 0.5% to 0.7% of the pore volume;(iii) the method of calculating the pore volume of the treatment area (considering overlap and drift outside the treatment area); and (iv) an increase in number of DPT sampling days from three to five. The cost from the Step 2 EE and the Step 3 EE were compared on the cost per cubic yard treated. Based on this comparison it was determined that although the treatment volume increased from 3,390 $yd^3$ to 4,317 $yd^3$ the cost per cubic yard was similar.

If the injection technique proposed in the IMWP is utilized, do not anticipate daylighting issues in any existing monitoring wells (no daylighting issues occurred at LC34 Hot Spot 1 where monitoring wells [with secure caps] were within 2 feet of injection locations). If an alternative injection vendor/technique is ultimately utilized, the abandonment of the

existing monitoring wells within the treatment area should be considered in the IM Implementation Work Plan.

Team consensus reached on IMWP with the following revisions: (i) modify the language to clarify that any vendor can be utilized for the DPT injection work; (ii) clarify that injection boreholes will be abandoned by tremie grouting the boreholes after injection; (iii) increase monitoring well pad size to 2′x2′x6″ with reinforcement; (iv) add language to indicate that proposed monitoring wells MWA, MWC, MWF, MWH, and existing wells MW0024, MW0026, and IW0014I will be utilized for monitoring for mounding during injection activities; (v) remove the Step 4B EE and the costing; (vi) and provide coordinates for DPT injection locations.

**Results**: Decision item 1405-D24

| | | |
|---|---|---|
| 1504-M05 | Lane Dorman/ Geosyntec | Contractors Road Heavy Equipment Area (SWMU 055)<br>**Goal**: Present Step 1 EE for Hot Spot 2, High Concentration Plume (HCP), and Low Concentration Plume (LCP). Obtain team consensus on horizontal and vertical delineation for Hot Spot 2, HCP and LCP. Obtain team consensus on technologies retained for Step 2 evaluation. Obtain team consensus on the interim groundwater monitoring plan.<br><br>**Discussion**: A site-wide groundwater sampling event completed in March 2012. Twenty-four monitoring wells were sampled for VOCs. Detected concentrations for TCE ranged from 0.6 I to 1,000 µg/L in eight wells. Detected concentrations for cDCE ranged from 0.44 I to 9,700 µg/L in 19 wells. Detected concentrations for VC ranged from 13 to 7,600 µg/L in 17 wells.<br><br>Activities completed since Step 1 Hot Spot 1 include: 781 DPT groundwater samples from 97 locations, data gap sampling, implementation of MOT plan for sample collection along Kennedy Parkway and Contractors Road, and land clearing east of Kennedy Parkway for delineation of Hot Spot 2.<br><br>For figures greater than 56 ft BLS, the data presented is the result at the bottom of each location in order to show vertical delineation.<br><br>Added a call-out box in final presentation loaded to RIS to explain what samples were used to contour intervals 16 to 30 and 31 to 46 ft BLS for VC when sample spacing did not meet the EE suggested spacing. There were areas where we were able to sample in the past, but were not allowed to go back to collect additional samples due to utility concerns, etc. There were submerged areas we used mats to sample, but due to differing site conditions we were not able to use mats in all submerged areas. In the future, presentations on any site, team needs to convey such information to eliminate further comments such as these.<br><br>Team felt it would be helpful to provide lithology information for the mapped interval. Need to call them out better on the map or at least call out in presentation. Items get hidden in notes on the figures.<br><br>Team consensus reached on delineation of TCE, cDCE, and VC delineation in Hot Spot 2. |

Team consensus reached on delineation of TCE, cDCE, and VC in the HCP site wide.

Team consensus reached on delineation of TCE, cDCE, and VC in the LCP site wide.

Team consensus reached to retain bioremediation with recirculation, air sparging, and MNA for evaluation in Step 2 with possibility of scaling bioremediation, MNA, and air sparging to larger treatment area.

Step 2 would not be conducted until there is some performance data from the Hot Spot 1 treatment which has been funded this year.

Team consensus reached on Interim groundwater monitoring plan as presented in the April 2015 ADP.

**Results**: Decision item 1502-D25 to D29

- 2000: Corrective Measures Study (CMS) (HSW, Inc.)
  - *Site clean up goals established for industrial setting*
  - *LUCIP for groundwater*
  - *No active corrective measures recommended*
  - *LTM program to monitor natural attenuation of CVOCs in groundwater*
  - *10 year estimated timeframe to reach cleanup goals*
- 2000 – 2005: Semi-annual GW sampling in 7 wells
- 2005 – 2009: Site incorporated into VAB LTM program

Geosyntec consultants

# Site Background (cont.)

- Feb 2009: Geosyntec recommended additional gw assessment due to elevated cDCE and VC in IW18I and IW19I (2008 LTM Report)
- June to August 2009: Supplemental DPT investigation conducted to assess potential residual source area
  - *Focused on northern area*
  - *No TCE identified (cDCE up to 2,100 µg/L, VC up to 1,200 µg/L)*
- 2010: Removed from LTM program
- 2010-2012: Implementation of supplemental assessment activities
  - *Expanded activities toward south*
  - *Identified TCE source area with max concentration of 160,000 µg/L*

Objectives
Site Overview/ Background
Site Conditions
Plume Delineation
Test Consensus

# Supplemental Site Assessment

- 2 MIP profiles
- DPT groundwater samples
  - *1,132 from 173 locations*
  - *Generally sampled from 16 to 50 ft BLS at 4 ft intervals*
  - *Some sampling to 65 ft BLS for vertical delineation*
- Water level measurements (Nov-09 and Mar-12)
- Lithology borings (7 borings to 80 ft BLS)
- Monitoring well installation (supplemented 25 existing wells)
  - *4 shallow (<15 ft BLS)*
  - *11 intermediate (35 to 50 ft BLS)*
  - *2 deep wells (60 to 70 ft BLS)*
- Monitoring well sampling

# Hydrogeologic Site Conditions

- General groundwater flow direction
  - *Shallow: W to SW*
  - *Intermediate: NW and SW*
  - *Deep: SE (based on 3 wells in southern portion of site)*
- Depth to Groundwater 2 to 6 ft BLS
- K of 7.6 ft/d (2,758 ft/yr) from specific capacity tests on shallow and intermediate wells during RFI

| GW Zone | Approx. Depth (ft, BLS) | Average Gradient (ft/ft) | Est. GW Flow Velocity (ft/y) |
|---|---|---|---|
| Shallow | <15 | 0.002 | 28 ft/y |
| Intermediate | 15 to 55 | 0.005 | 69 ft/y |
| Deep | >60 | 0.002 | -- |

-- = not calculated, site-specific hydraulic data not available for this groundwater zone.
Assumed porosity of 0.20.

# Response to Comment

TT #1: The conversion for the K value from ft/d to ft/yr appears to be slightly miscalculated.

- *Data taken directly from RFI prepared by others.*
- *Discrepancy is rounding difference of less than 1%.*

# MIP Results

Yellow highlighting indicates concentrations above NADCs.

# Response to Comment

Arcadis General #1: In SZ, spacing is ~35 to 50 ft. A MIP boring was advanced adjacent to DPT72 with good correlation between MIP response & DPT GW data; however, no additional MIPs were conducted in SZ.

- *2 days of MIP was planned but equipment malfunctioned.*
- *Objective of MIP was to identify mass distribution in SZ to confirm sample intervals.*
- *Objective met and proceeded with DPT sampling.*
- *Spacing between SZ DPT locations is 13 to ~50 ft.*
- *Additional sampling locations proposed.*

Objectives

Site Overview/ Background

Site Conditions

Plume Delineation

Test Consensus

# Response to Comment

TT #3: SE plume with HS area is defined by one detection and multiple elevated DLs. Will data set suit for future remedial decision making? HCP footprint potentially overestimated.

- *TCE HCP is defined by 2 detections (3,000 µg/L at DPT92, 3,800 µg/L at DPT97) and elevated DL in 3rd loc (2,000 U at DPT96).*
- *cDCE and VC confirm that overall HCP is well-defined (i.e., cDCE of 22,000 µg/L at DPT92, 34,000 µg/L at DPT96, and 52,000 µg/L at DPT97, and VC of 2,600 µg/L at DPT92, 7,700 µg/L at DPT96, and 1,500 µg/L at DPT97).*
- *These locs are surrounded by NDs.*
- *HCP based on true NADC exceedances and focus of proposed remedial action will not be driven by elevated DLs.*

Objectives
Site Overview/ Background
Site Conditions
Plume Delineation
Test Consensus

# Response to Comment

Arcadis #1: TCE plumes are conservatively interpreted based on elevated DLs at locs such as DPT116/DPT20...consideration should be given to collecting confirmation samples to simplify CSM and refine affected distribution of COCs.

- *Elevated DL for TCE surrounded by DPT locations at less than 25 ft spacing with results of 1 U.*
- *Relatively low concentrations in this area (primarily of VC) so this will not affect any proposed remedial strategy.*

Geosyntec consultants

# TCE 31 to 46 ft BLS

Test Consensus

Geosyntec consultants

# Response to Comment

Arcadis General #2: Near DPT139, closest borings to W and E are ~100 ft and 65 ft. Does CSM assume that contamination is from SZ or was there a separate release that may have occurred adjacent to the RR?

- *Current CSM - impacts are remnants from identified SZ.*
- *Unlikely that separate release would result in dissolved plume with geometry that so closely mimics that of centerline of main plume.*
- *Increased drainage around RR, wooded areas, and from paved surfaces that could potentially cause plume to appear divided.*
- *Additional DPT locations proposed on 25 ft spacing to confirm data set.*

Test Consensus

# Response to Comment

TT Comments #4, 5, 8: Further delineation around DPT174 to W and SW may be necessary.

- *Area typically wet and/or submerged.*
- *Accessible areas were sampled on grid pattern.*
- *Given GW flow direction and shape of dissolved plume, DPT dataset provides adequate data at this time since this area will not likely be remediated in near future.*
- *Additional sampling locations are proposed.*

# Response to Comment

TT #7: Recommend tighter boundary data points around DPT80/149/161 HCP (Fig 20).

*Additional sampling locations are proposed.*

Geosyntec consultants

# Response to Comment

Arcadis #4: VC HS extends from TCE SZ toward DPT131…Another HS begins downgradient at DPT80. How does this separate HS fit into CSM…?

- *Current CSM assumes that downgradient HS associated with main SZ, not separate release.*
- *Unlikely that separate release would result in dissolved plume with geometry similar to centerline of main plume.*
- *Limited access for DPTs in the area.*
- *Additional sampling proposed in this area to refine the dataset if/when typically saturated area is accessible.*
- *No plans to clear cut the area.*

# Response to Comment

Arcadis #3: TCE in DPT72 at 43.8 µg/L at 61 to 65 ft BLS. Is TCE delineated to GCTLs at depth in this area?...

- *TCE at 56-60 and 61-65 ft in DPT72 likely associated with dragdown from 160,000 µg/L at 36-40 ft BLS.*
- *After sampling at this loc, driller replaced decon water more frequently to mitigate potential dragdown issues.*
- *Additional sampling proposed for confirmation sampling at 46-50 ft, 56-60 ft, and 61-65 ft BLS adjacent to DPT72.*
- *Vertical delineation well will be considered as part of performance network when/if active remediation proceeds in this area.*

Geosyntec consultants

# Response to Comment

Arcadis #5 and TT #9: VC>GCTLs in deepest samples...

- DPTs to 65 ft BLS across site at regular lateral intervals.
- Clean bottom samples at 78% of completed sample locs.
- VC>GCTL (59.9 to 720 µg/L) at indicated locs but these DPTs were terminated at 50 ft BLS, as planned.
- One of these locs, TCE>GCTL in deepest sample (DPT129). TCE vertically delineated at DPT139 (65 ft away).
- VC in DPT131 (2.5 µg/L) exceeds GCTL - single digit VC concentration.
- DPTs 136, 139, 64, 144, & 145 in immediate vicinity-clean bottoms at 60 to 65 ft BLS.
- Additional vertical delineation samples proposed, primarily in SZ, at locs where VC in deepest sample is above GCTL.

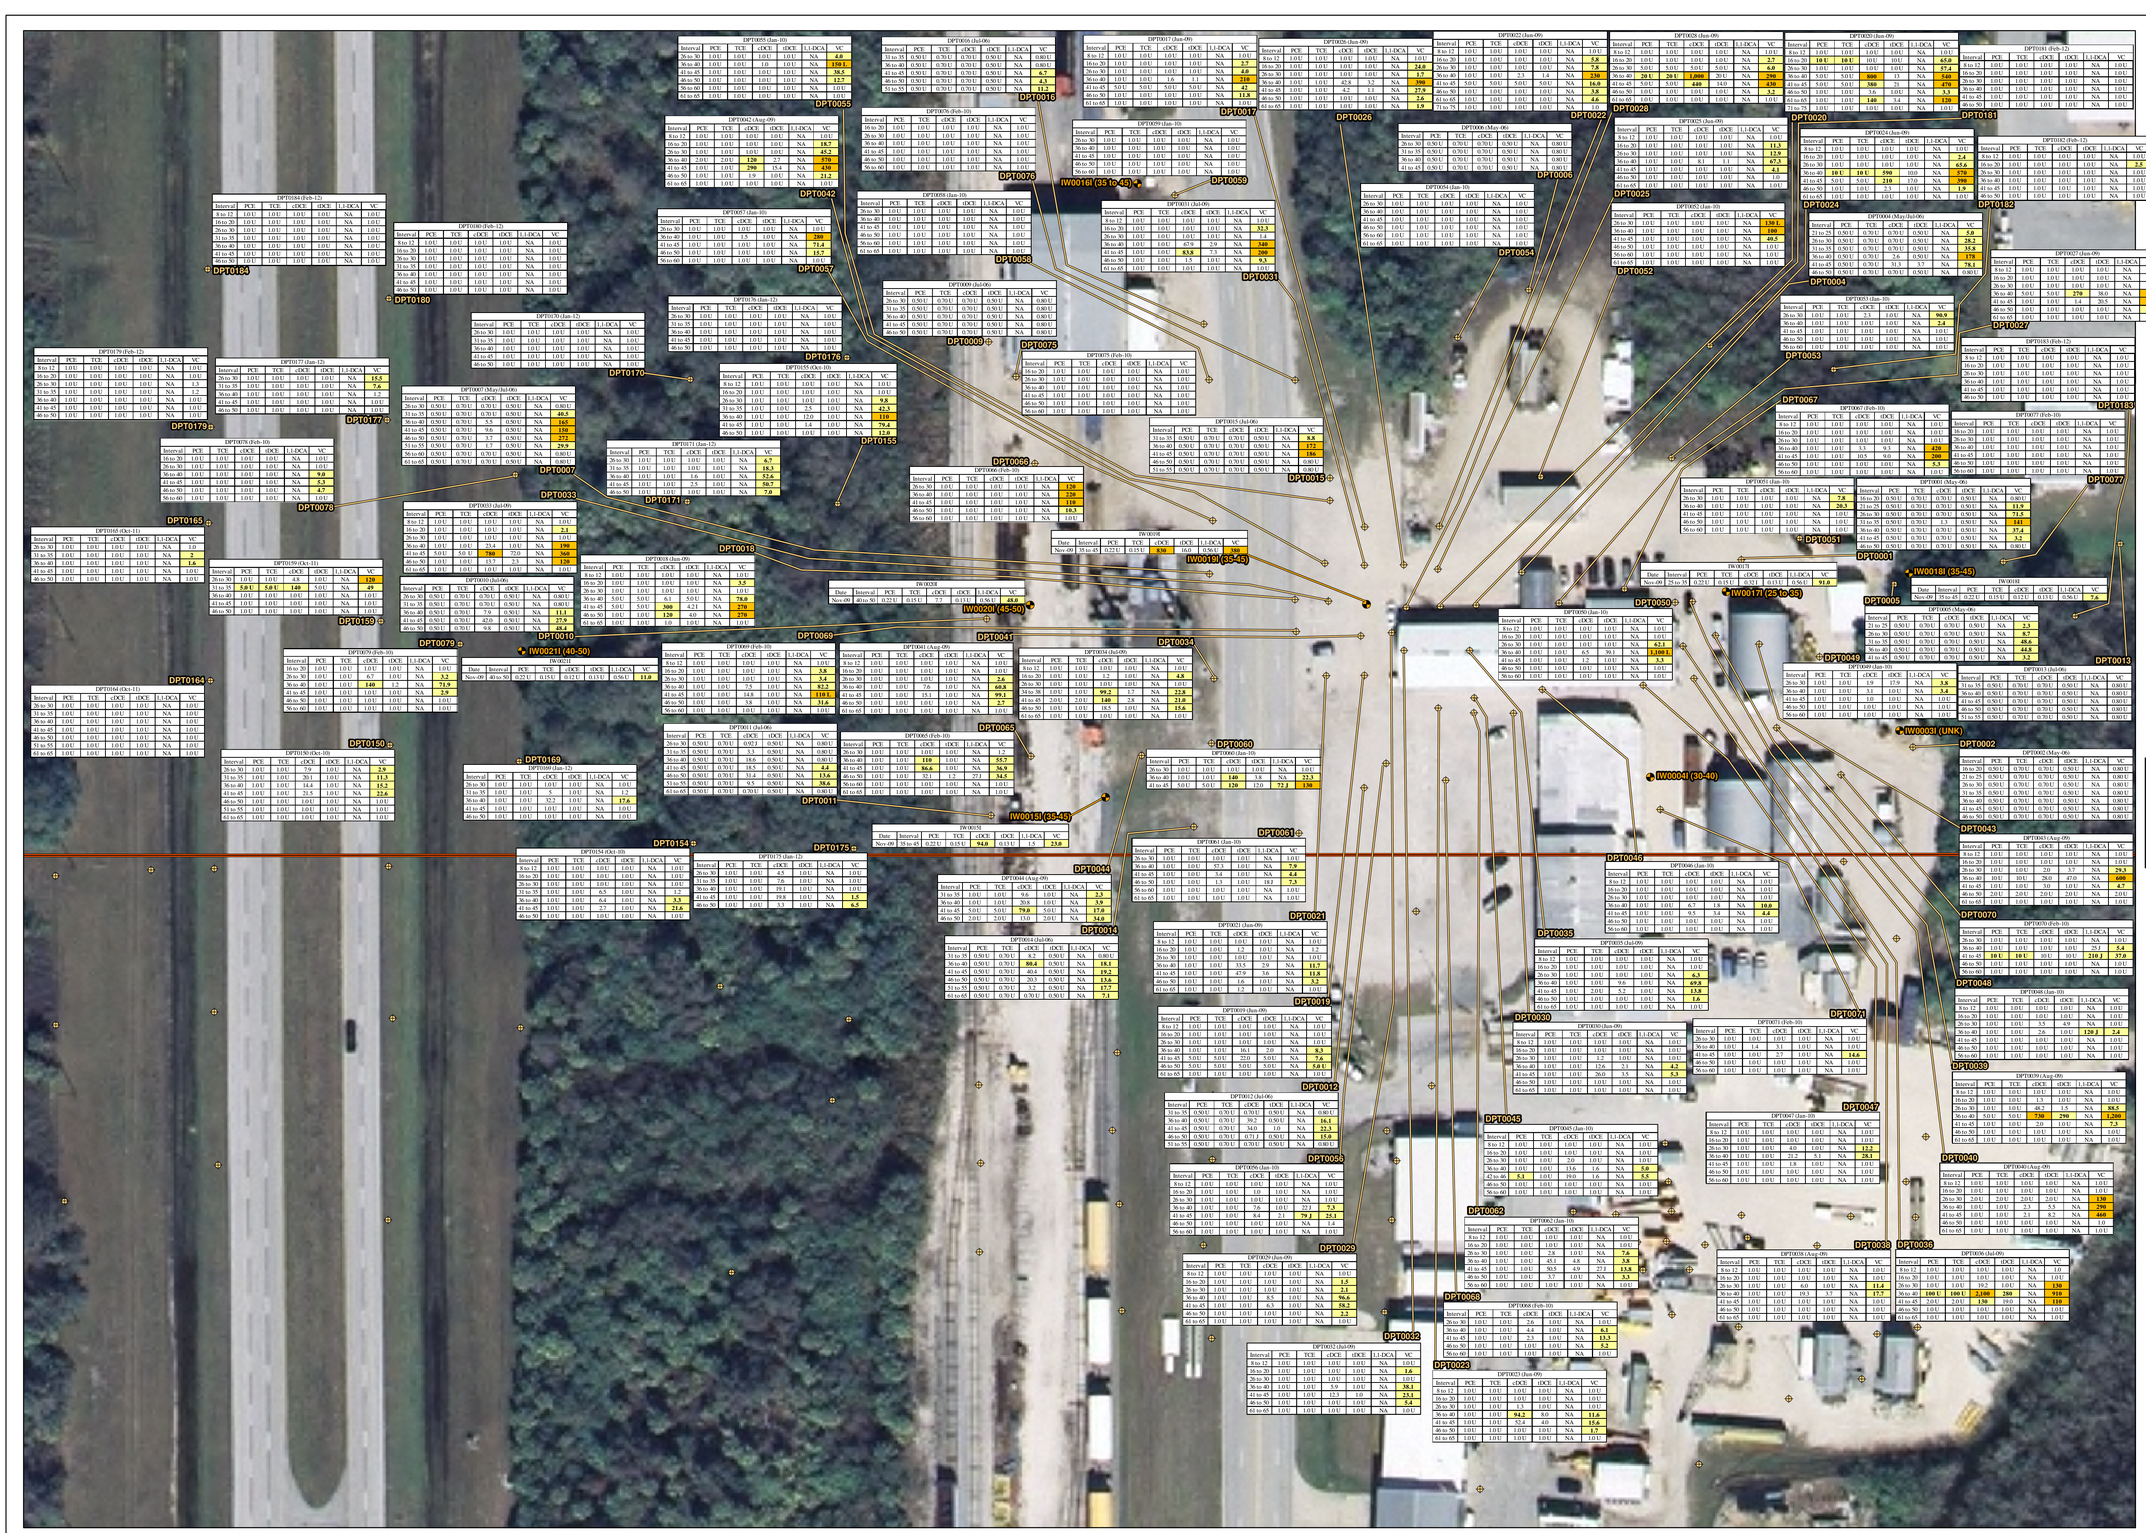
Figure 7
CRHE Environmental Sampling Locations



| Parameter | Abbreviation | GCTL | NADC |
|---|---|---|---|
| Tetrachloroethene | PCE | 3 | 300 |
| Trichloroethene | TCE | 3 | 300 |
| cis-1,2-Dichloroethene | cDCE | 70 | 700 |
| trans-1,2-Dichloroethene | tDCE | 100 | 1,000 |
| 1,1-Dichloroethane | 1,1-DCA | 70 | 700 |
| Vinyl Chloride | VC | 1 | 100 |

Notes:
1. Screen interval is presented in feet below land surface (ft BLS).
2. Results are presented in micrograms per liter (µg/L).
3. I indicates result is between the method detection limit and the practical quantitation limit.
4. J indicates estimated value.
5. U indicates value was not detected above the method detection limit.
6. L indicates value exceeds the calibration range.
7. Yellow shaded, bold text indicates exceedance of Florida Department of Environmental Protection (FDEP) Groundwater Cleanup Target Level (GCTL).
8. Orange shaded, bold text indicates exceedance of FDEP Natural Attenuation Default Concentration (NADC).

Figure 8
CRHE Area Summary Groundwater Sampling Results - Northern Portion of Site

## Legend

- DPT Sampling Location
- Intermediate Monitoring Well Location showing screen interval (ft BLS)
- North/South Boundary Line (data for locations north of this line can be found on Figure 8).

| Parameter | Abbreviation | GCTL | NADC |
|---|---|---|---|
| Tetrachloroethene | PCE | 3 | 300 |
| Trichloroethene | TCE | 3 | 300 |
| cis-1,2-Dichloroethene | cDCE | 70 | 700 |
| trans-1,2-Dichloroethene | tDCE | 100 | 1,000 |
| 1,1-Dichloroethane | 1,1-DCA | 70 | 700 |
| Vinyl Chloride | VC | 1 | 100 |

Notes:
1. Screen interval is presented in feet below land surface (ft BLS).
2. Results are presented in micrograms per liter (µg/L).
3. Indicates results between the method detection limit and the practical quantitation limit.
4. J indicates estimated value.
5. U indicates value was not detected above the method detection limit.
6. L indicates value exceeds the calibration range.
7. Yellow shaded, bold text indicates exceedance of Florida Department of Environmental Protection (FDEP) Groundwater Cleanup Target Level (GCTL).
8. Orange shaded, bold text indicates exceedance of FDEP Natural Attenuation Default Concentration (NADC).

| Subject: | Contractor's Road Heavy Equipment Area (CHRE) (SWMU 082) Step 1A and Step 1B Engineering Evaluation – Response to Comments |

Comments on the Step 1A and Step 1B Engineering Evaluation were received and are addressed below. The comment is listed first and Geosyntec's response is listed in italics below the comment.

**Arcadis Comments:**

The Step 1 Engineering Evaluation package for Contractors Road Heavy Equipment Area (CHRE) meets the requirements specified in the KSC Remediation Team Engineering Evaluation Process document. Based on our review of the ADP, sufficient data are available to advance the CRHE facility in the engineering evaluation process. However, closer spacing of borings may be considered to reduce uncertainties in the following areas:

- In the Source Zone, spacing between borings are approximately 35 to 50 feet such as between DPT0134 and DPT0098. Also, a MIP boring was advanced adjacent to DPT072 and there was good correlation between MIP response and the DPT groundwater data; however, no additional MIPs were conducted in the Source Zone. The typical application of MIP is to assess Source Zones. Additional DPT or MIP borings to reduce the spacing could provide further data on the potential presence of NAPL and its distribution.

  *Response: Comment on spacing noted. However, the spacing between the DPT locations identified above is the largest spacing in this area and several of the locations in this area are as close as 13 to 15 ft apart. Additional sampling locations have been proposed in this area to meet spacing guidelines. Originally, two days of MIP logging was planned; however, during advancement of the second location, the equipment malfunctioned. At this site, the MIP was intended to identify likely distribution of mass in the source zone to confirm that we sampled the appropriate depth intervals. It was*

*decided that the data obtained from the MIP before it malfunctioned was adequate to meet this objective and we proceeded with DPT sampling, which provided a robust data set.*

- Adjacent to the railroad line near DPT0139, the closest borings to the west and east are approximately 100 feet and 65 feet, respectively. Does the conceptual site model assume that this contamination is from the Source Zone or was there a separate release that may have occurred adjacent the rail line?

  *Response: The current CSM for the site assumes that these impacts are remnants from the identified source zone. It seems unlikely that a separate release would result in a dissolved plume with geometry that so closely mimics that of the centerline of the main plume emanating from the Source Zone. Additionally, there is likely increased drainage around the railroad tracks, wooded areas, and from paved surfaces that could potentially cause the plume to appear divided in this area. However, the DPT spacing in this area is about 50 ft and since the TCE concentration is just over 10X NADC, additional DPT locations are proposed in this area on a 25 ft spacing to confirm the data set.*

  *Along this same line of thought, we propose to advance an additional DPT location between DPT136 and DPT129 since there is potential that this very narrow TCE plume (TCE on >46 ft map) is passing between these two locations and then showing up at DPT139. This will also help to validate the CSM that the dissolved TCE, cDCE, and VC concentrations observed downgradient are associated with the upgradient release, not a separate source at this location.*

The following are ARCADIS' observations based on our review of the ADP package:

1. TCE plumes are conservatively interpreted based on elevated laboratory detection limits at locations such as DPT0116 and DPT0020. These isolated TCE plumes fall within the footprint of the composite plume and do not affect proposed remediation but consideration should be given to collecting confirmation monitoring well or DPT samples to simplify the conceptual site model (CSM) and refine the affected distribution of the chemicals of concern.

   *Response: Comment noted. In one of the areas indicated above, the elevated detection limit for TCE (16 to 30 ft BLS) in DPT0020 is surrounded by DPT locations at less than 25 ft spacing with results of 1 U. Given the relatively low concentrations in this area (primarily of vinyl chloride), as noted above, this will not affect the proposed remedial strategy.*

2. The contouring should be re-evaluated based upon the November 17, 2011 FDEP Rounding Memorandum. Several examples where the contour lines could be reduced are on Slide 24 at DPT0122 where TCE is 3.1 µg/l and Slide 30 where vinyl chloride concentrations could be rounded downward at DPT0162, DPT0174, and DPT0065.

   *Response: So noted. On Slide 24, the contour line is touching the symbol for DPT0122 so the isopleth was not revised but the symbol color was changed to green. Also, the contours indicated on Slide 30 have been corrected in the revised ADP, as well as similar edits to the map on Slides 31 and 32.*

3. EVS for TCE and DPT072 – A review of TCE concentrations in DPT072 show TCE at a concentration of 43.8 µg/L at a depth of 61 to 65 ft BLS. Is TCE delineated to GCTLs at depth in this area? The EVS graphic also shows the vertical depth not confirmed. Should this vertical delineation be confirmed with additional DPT or a vertical depth monitoring well? Please clarify the rationale for not installing a monitoring well in the Source Zone for comparison with direct push data such as DPT0072?

   *Response: We believe that the TCE concentrations observed at the 56 to 60 and 61 to 65 ft samples at this location are likely associated with dragdown from the 160,000 µg/L observed at 36 to 40 ft BLS at this location. After sampling at this location, we had our DPT subcontractor replace their decontamination water more frequently to mitigate potential dragdown issues. We propose to collect confirmation samples at 46 to 50 ft, 56 to 60 ft, and 61 to 65 ft BLS adjacent to DPT072 to confirm vertical delineation in this area (though it is certainly possible that these locations will contain low-level TCE concentrations). Also, a vertical delineation well will be considered in this area as part of a performance network when/if active remediation proceeds in this area of the site.*

4. Slide 31 – On this slide, vinyl chloride concentrations at the 31 to 46 ft BLS interval are presented and indicate a vinyl chloride Hot Spot that extends from the TCE Source Zone toward DPT0131. Another Hot Spot begins approximately 170 feet hydraulically down gradient at DPT0080. How does this separate Hot Spot fit into the conceptual site model; is this further down gradient Hot Spot associated with a separate release near the rail line?

   *Response: The current CSM assumes that the down gradient Hot Spot is associated with the main Source Zone, not a separate release. It seems unlikely that a separate release would result in a dissolved plume with geometry that so closely mimics that of the centerline of the main plume emanating from the Source Zone, as discussed previously. There was limited access for DPT sampling in this area; however, if we could conduct additional sampling in this area, it is likely that the plumes would connect. Additional*

*sampling has been proposed in this area to refine the dataset for completion if/when this typically saturated area is accessible.*

5. EVS for VC and Figure 9 – There are multiple locations where VC concentrations are well above GCTLs in the deepest DPT locations; these include DPT0174, DPT0148, DPT0149, DPT0158, DPT0129, and several others with lower concentrations but still above GCTLs. Should deeper DPT intervals be investigated or vertical delineation confirmation with monitoring wells be completed at these locations?

   *Response: While it is true that VC concentrations are above GCTLs in the indicated locations (concentrations range from 59.9 to 720 µg/L), these DPT locations were terminated at 50 ft BLS, which is towards the base of the identified impacts (just above the identified semi-confining unit). DPT borings were advanced across the site for vertical delineation purposes at regular lateral intervals to 65 ft BLS and clean bottom samples were obtained at 78% of completed sample locations. The majority of the remaining samples only slightly exceeded the GCTL and the other locations (as listed above and another comment below) were terminated at approximately 50 ft BLS because there are nearby samples that were advanced to 60 to 65 ft BLS for vertical delineation purposes. It should also be noted that only one of these locations has TCE above GCTL in the deepest sample (DPT0129). At this location, TCE is vertically delineated at DPT0139, 65 ft away.*

   *From a holistic site perspective, the overall site data indicates that the vertical delineation completed at the site achieves the intended purpose based upon: (i) DPT sampling results; (ii) EVS model iso-solid interpretation; and (iii) site lithologic characteristic. However, additional vertical delineation samples have been proposed, primarily in the Source Zone area, at locations where VC concentrations in the deepest sample are above the GCTL.*

6. The mass estimates were presented in Slides 37 and 38. Slide 37 indicates that the mass was only estimated for the plume area >10x NADCs. It would be beneficial to have mass estimates for the Source Zone, Hot Spots, High Concentration Plume, and Low Concentration Plume for future use in the Step 1b and Step 2 engineering evaluations.

   In addition on Slide 37, the table indicates calculation of mass greater than 10x NADCs. We believe this should say mass less than (< 10xNADC)?

   *Response: Slide 37 has been updated to include mass estimates for the Source Zone, Hot Spots, High Concentration Plume, and Low Concentration Plume.*

7. A comprehensive list of technologies were evaluated and screened for applicability to remediate the Hot Spots and Source Zone. Bioremediation and air sparging were retained for further evaluation for the Hot Spots and Source Zone. In addition, EZVI™ was retained for potential application in the Source Zone. We generally concur with the screening process, rationale, and retained technologies.

   We would recommend consideration for the development of various alternatives of the retained technologies for cost comparisons. For example, consider evaluating air sparge wells with radius of influence coverage across the entire Hot Spot versus use of picket fence spacing of sparge wells. The same type of evaluation could also be considered for the bioremediation alternative including use of recirculation.

   *Response: Comment noted. Given the limited aerial extent of the Hot Spots and Source Zone, customized alternatives will be developed for each retained alternative, which is consistent with the approach taken at other sites.*

8. We concur with the identified data gaps and would recommend that these be addressed prior to development of the Step 2. In addition, further assessment in locations as identified above should be considered.

   *Response: Additional DPT locations are proposed and results will be presented to the NASA Remediation Team in a subsequent data gap ADP.*

**Tetra Tech Comments:**

Tetra Tech generally concurs with the information presented in the Contractor's Road Heavy Equipment Area (CRHE) Step 1A and 1B Engineering Evaluation ADP, with the following comments:

Step 1A Comments:

1. Slide 18 – The conversion for the K value from ft/d to ft/yr appears to be slightly miscalculated, assuming 365 days/year.

   *Response: These data were taken directly from the RFI document prepared by others. The discrepancy is a rounding difference of 0.6%, which arose from the previous consultant reporting a rounded K value of 7.6 ft/d rather than 7.556 ft/d.*

2. Slide 19 – Please reference the yellow highlighting for the analytical results for DPT072 and DPT100 represent, possibly concentrations greater than NADC?

   *Response: Slide 19 has been revised to include a note to reference that the yellow highlighting represents concentrations greater than NADCs.*

3. Slide 22 – The southeastern plume with a hot spot area is defined by one actual detection and multiple elevated detection limits. Will the data set suit for future remedial decision making? In this case, the HCP footprint could potentially be overestimated.

   *Response: We do not believe that the HCP is overestimated. While the TCE HCP on this figure is defined by detections in only two locations (3,000 µg/L at DPT092 and 3,800 µg/L at DPT097) and an elevated detection limit in a third location (2,000 U at DPT096), the cDCE and VC concentrations at these locations confirm that the overall HCP in this area of the site is well-defined (i.e., cDCE of 22,000 µg/L at DPT092, 34,000 µg/L at DPT096, and 52,000 µg/L at DPT097, and VC of 2,600 µg/L at DPT092, 7,700 µg/L at DPT096, and 1,500 µg/L at DPT097). Also, these locations are surrounded by non-detect concentrations. The overall HCP plume in this area is based on true NADC exceedances and the proposed focus of remedial action will not be driven by elevated detection limits.*

4. Slide 27 – Further delineation surrounding DPT0174 to the west and southwest may be necessary.

   *Response: This area is typically wet and/or submerged so we sampled accessible areas on a grid pattern in areas we were able to clear and access. We believe the DPT dataset provides adequate data at this time given the groundwater flow direction, north to south extent of the plume, and shape of the dissolved plume. We concur that higher resolution spacing may be appropriate if active remediation is conducted in this area but since the COCs in the vicinity of DPT174 are daughter products, and like similar sites, this area of the site may not be actively remediated in the near future, we considered the delineation adequate. However, based on Team feedback, additional sampling locations have been proposed in this area.*

5. Slide 28 – An additional sample location southwest of DPT0174 may be necessary to define the HCP.

   *Response: See above response.*

6. Slide 30 – Recommend further delineation of NADC exceedances at DPT0159, DPT066, and DPT0052, detected in the northern portion of the site to attain recommended criteria of 50 ft spacing for HCP.

   *Response: The concentrations at the indicated locations are not significantly above NADCs (120 to 130 µg/L) and are not parent compound (VC only). However, based on Team feedback additional locations have been proposed in the indicated areas.*

7. Slide 31 – Recommend tighter boundary data points around the DPT0080/0149/0161 HCP.

   *Response: We recommend that additional sampling be completed if/when active remediation is conducted in this area; however, based on Team feedback additional locations have been proposed in the indicated areas.*

8. Slide 32 – Recommend further delineation southwest of DPT0174.

   *Response: See above responses for Slides 27 and 28.*

9. Figure 9 – Several DPT locations have exceedances at their deepest interval (for example, 127, 129, 130, 135, 148, 149, 174), usually at 46'-50' bgs. Concentrations at several of these locations, such as 127, 148, 158, and 174, are fairly high. There is vertical delineation at some nearby points (including one deep well in the area), but at least one location, DPT131, also has an exceedance at 60+' bgs. None of the locations listed above (with the exception of DPT131) are shown on the CVOC cross-sections (Figures 22 and 23). Additional vertical delineation may be required.

   *Response: We do not feel that it is necessary to complete vertical delineation in every location, but DPT borings were advanced to 65 ft terminal depth across the site to provide overall vertical delineation of the plume. One of the benefits of conducting the EVS modeling while assessment activities are being conducted is to show visually that there are sample locations spread across the site providing vertical delineation of impacts without needing to advance every boring to non-detect concentrations. The VC concentration in DPT131 (2.5 µg/L) exceeds the GCTL, but the decision was made not to advance the boring further to delineate this single digit VC concentration. Additionally, it should be noted that DPT locations 136, 139, 064, 144, and 145 in the immediate vicinity of those listed above have clean bottoms at 60 to 65 ft BLS. Significant contaminant mass is not likely present at this depth; however; since this potentially represents a data gap, a boring will be advanced adjacent to DPT131 to collect a confirmation sample at 61 to 65 ft and possibly 66 to 70 ft BLS, if needed.*

Step 1B Comments:

- General – Further sampling may be needed to be performed in order to fully delineate HCP, Hot Spots, and Source Zone.

  *Response: Additional sampling has been proposed as discussed above.*

- Slide 6 – The mass is listed as 238 pounds; in the Step 1A, 224 pounds is used. Were different areas used for these two calculations? Since the technology screening is by plume interval, it would be beneficial to show mass distribution by plume interval.

  *Response: In the spreadsheet for the mass estimates, an extra cell was inadvertently included in the mass estimates when total dissolved and total sorbed numbers were calculated from the mass estimates by constituent. This has been corrected resulting in mass estimates of 224 and 227 pounds in the Step 1A and 1B ADPs, respectively (the difference of approximately 1% in these numbers is related to rounding).*

- Slide 12 – 0.75 acres seems like a good area for a heating project, especially considering the depth. It is not so small that the unit costs would be too high. Unless there is a different reason for not considering the heating technologies, it should potentially be retained.

  *Response: Originally heating technologies were retained, but as compared to the other potential options for this site (bioremediation and air sparging), the unit costs for heating technologies will be higher. Therefore, the decision was made to eliminate it at this step in the process.*

- Slide 15 – Additional data gaps - similar to the "General" comment above, better delineation of the HCP and hot spots will be required prior to design activities; we suggest that delineation to the KSC-recommended intervals be completed at that time.

  *Response: We agree that there are several areas, as discussed herein, which could be refined when/if NASA would like to conduct remediation in these areas. In the Source Zone, where Step 2 activities will likely be focused, we feel that the dataset is adequate for proceeding with the additional DPT locations that have been proposed.*

- Slide 17 – Hot Spots for cDCE and VC are not specifically addressed since TCE was separated out.

  *Response: Agreed. The technologies that have been recommended for retention for evaluation during the Step 2 EE are appropriate for TCE and daughter products. However, we did not focus on constituents on Slide 17 because we are seeking team consensus on the retained technology list, not areas of the site or constituents to be evaluated.*

# APPENDIX C

# STEP 1 FOR HS1
# ENGINEERING EVALUATION ADP
# (electronic copy only)

Geosyntec consultants

# Contractor's Road Heavy Equipment (CRHE) Area (SWMU055)

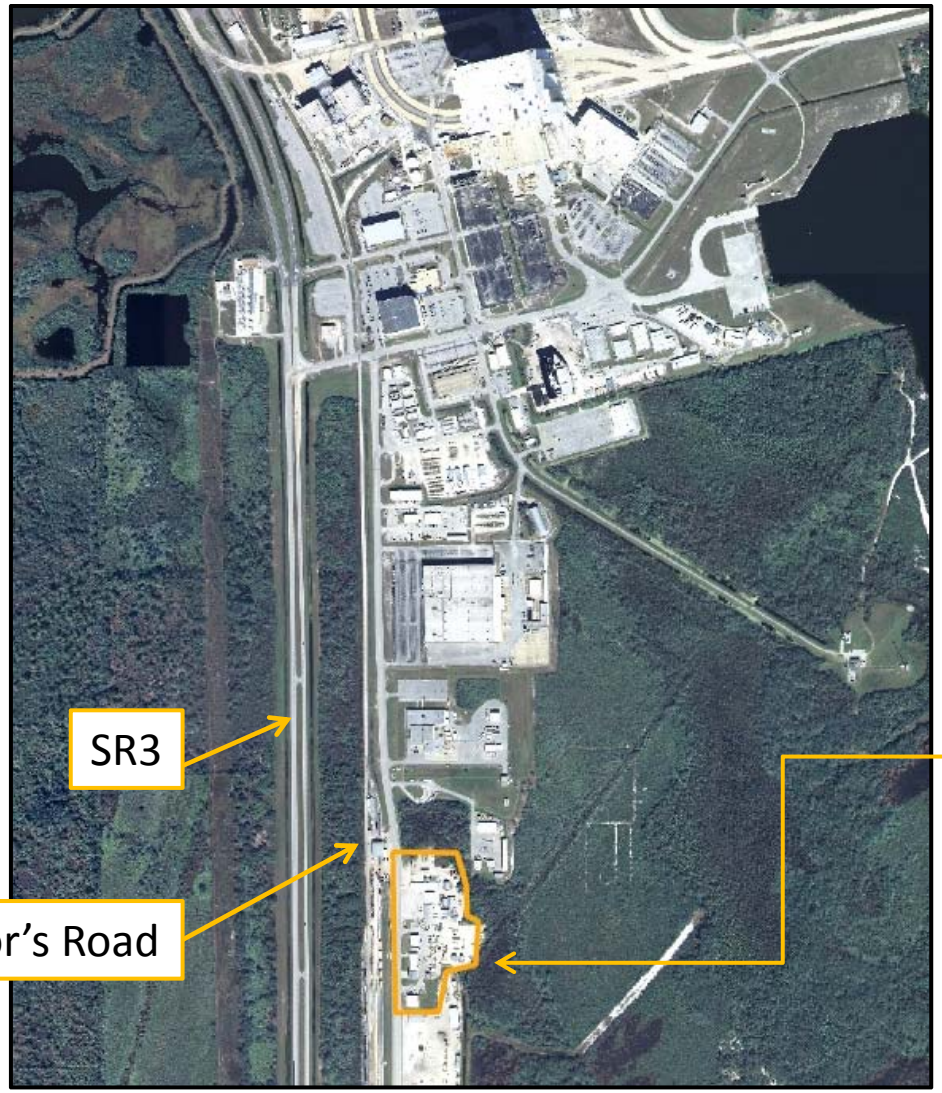
## Step 1 Engineering Evaluation – Hot Spot 1

December 2013

# Today's Presentation

- Step 1 Section A
  - Site Overview
  - Review of June 2012 Step 1 ADP
  - Definition of Hot Spot 1 (HS1) Area
  - Site Conditions
  - Summary of Supplemental Site Assessment Activities
  - Test Consensus
- Step 1 Section B
  - Review of Pertinent Site Conditions
  - List of Technologies
  - Engineering Data Gaps
  - Technologies Retained
  - Path Forward/Test Consensus

# Site Location



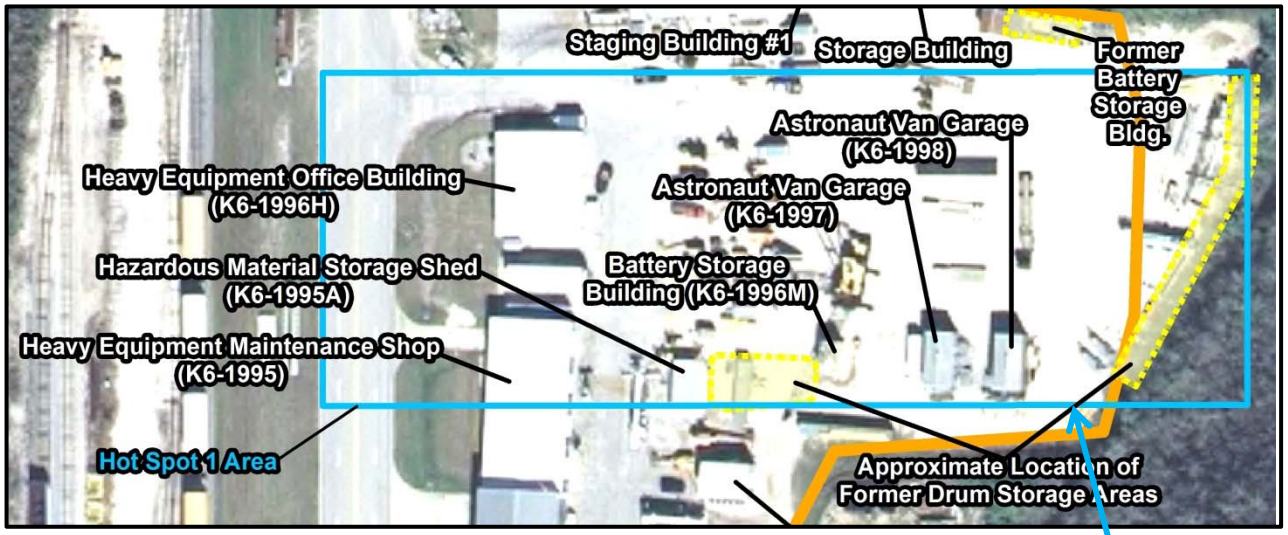
# Site Overview

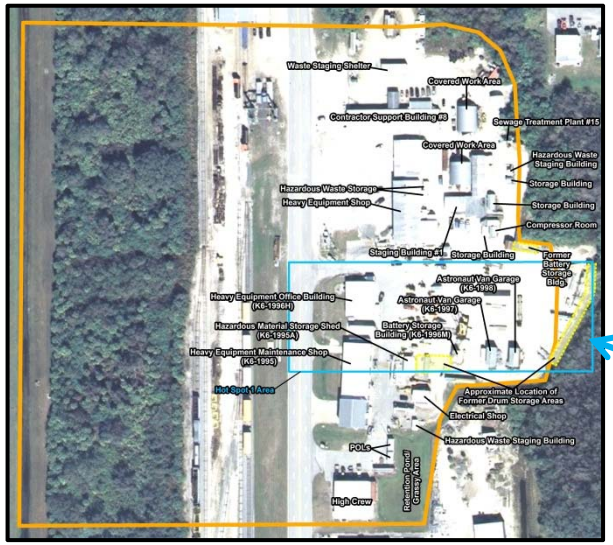
- Overall site features:
  - About 23 acres
  - Paved portions
  - Majority of site is gravel and dense woods
  - Many underground utilities
  - Thick road base in some areas to support heavy equipment
- Historical site use:
  - Hazardous Waste Storage/Staging
  - Printed Circuit Board Manufacturing
  - Domestic Wastewater Treatment
  - Heavy Equipment Maintenance/Storage (historical and current use)

*Photograph of heavy equipment storage at CRHE; view facing south from the Contractor's Road entrance driveway, with Heavy Equipment Office Building (K6-1996H) shown on far right.*

# Site Overview

- HS1 features:
  - About 3 acres
  - Paved and gravel
  - Underground utility corridor along Contractor's Road
  - Thick road base in northern part of HS1

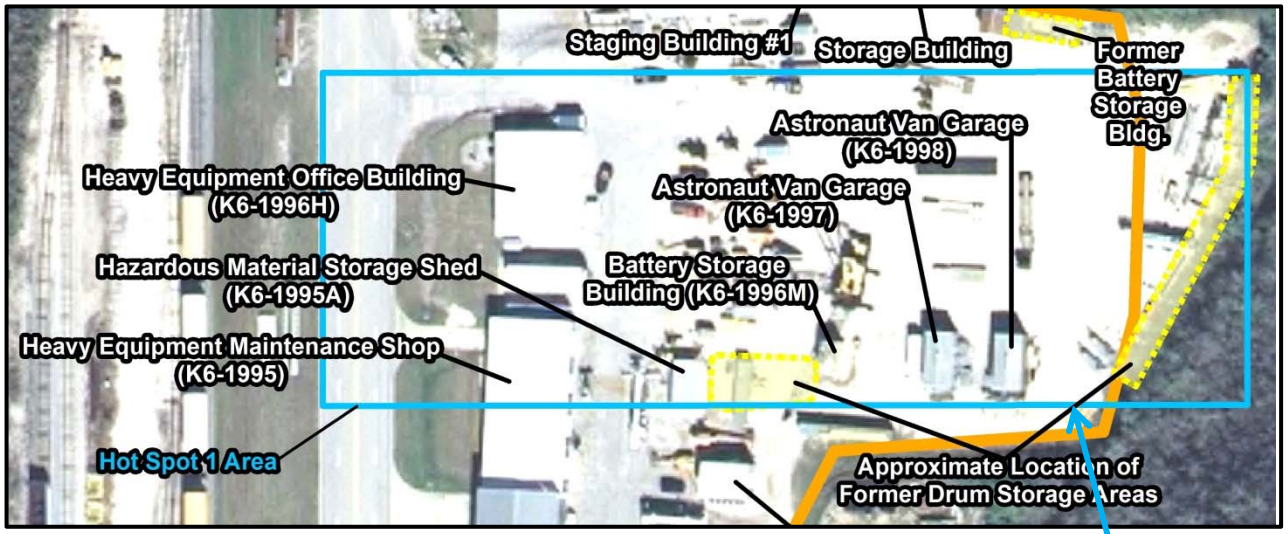


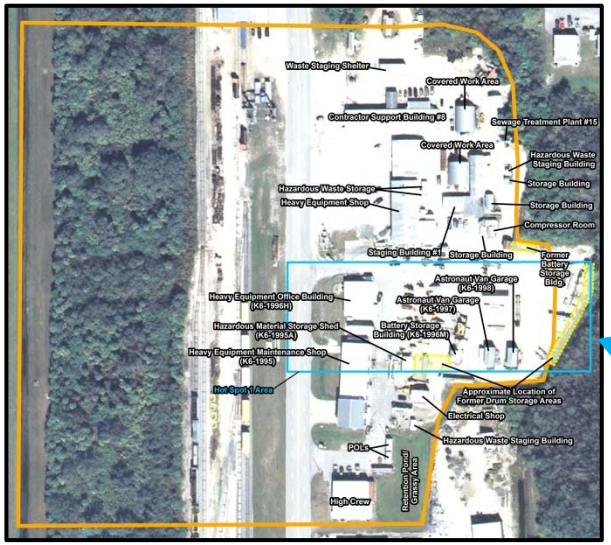


Hot Spot 1 Area

# Site Overview

- Numbered buildings and support structures in HS1
  - K6-1995: Heavy Equipment Maintenance Shop
  - K6-1995A: Hazardous Material Storage Shed
  - K6-1996H: Heavy Equipment Office Building
  - K6-1996M: Battery Storage Building
  - K6-1997 and K6-1998: Astronaut Van Garages





Hot Spot 1 Area

# Assessment Background

- 1994: Preliminary assessment (EG&G, Inc.)
  - Identified CVOCs and metals in GW
  - Recommended additional assessment
- 1997-1999: RFI (HSW, Inc.)
  - VC up to 370 µg/L in northern area (waterloo profiler)
  - TCE up to 41 µg/L (in IW-4I), down to 0.4 µg/L by end of RFI activities
  - Highest concentrations between about 15 and 45 ft BLS

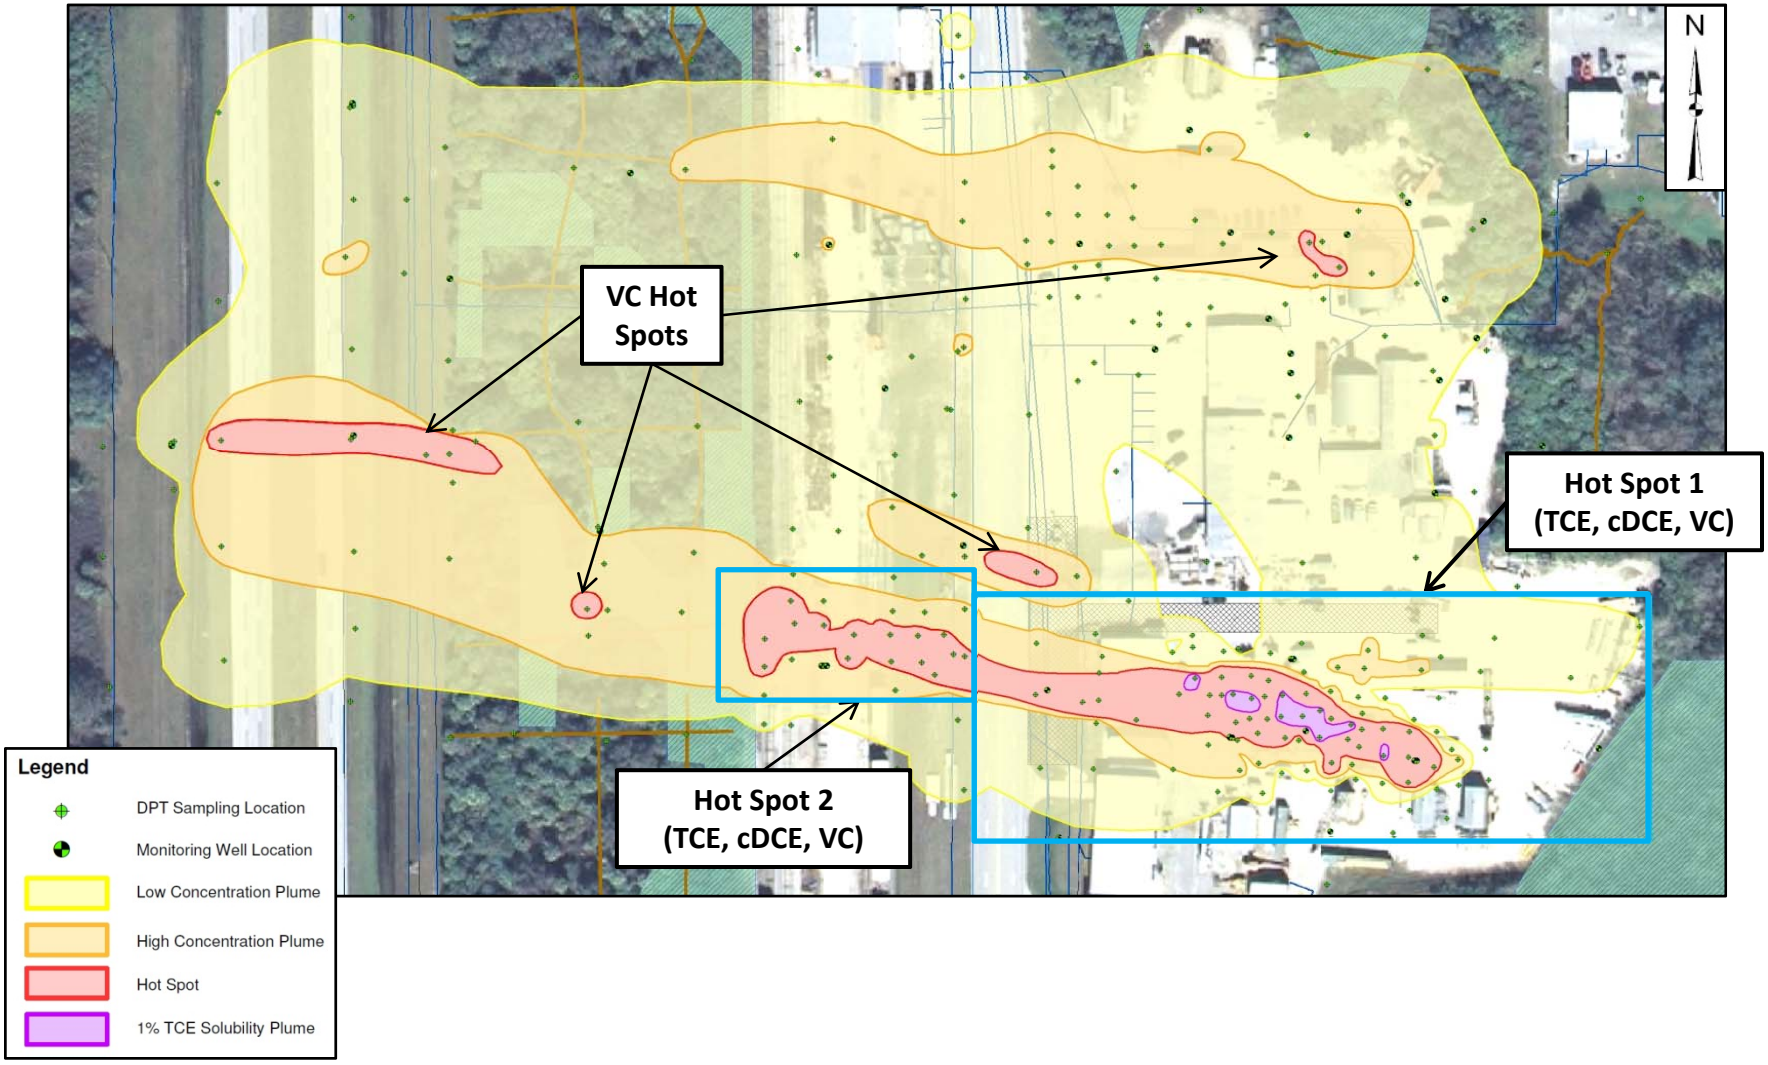
# Assessment Background

- 2000: Corrective Measures Study (CMS) (HSW, Inc.)
  - Site clean up goals established for industrial setting
  - LUCIP for groundwater
  - No active corrective measures recommended
  - LTM program to monitor natural attenuation of CVOCs in groundwater
  - 10 year estimated timeframe to reach cleanup goals
- 2000 – 2005: Semi-annual GW sampling in 7 wells
- 2005 – 2009: Site incorporated into VAB LTM program
- May 2010: Team approved discontinuing LTM program at the Site until assessment is complete
- 2009 – 2013: Supplemental Site Assessment

# Review of June 2012 Step 1 ADP

- Step 1 submitted for entire site in June 2012
- Team expressed concerns regarding delineation and recommended additional sampling
- Five weeks of additional sampling was conducted between October 2012 and June 2013
- Delineation of site-wide LCP, HCP, and HS2 is on-going
- Copy of June 2012 ADP and response to comments are included electronically with this ADP for reference

# Overall Site and Identification of Hot Spots



# Hot Spot 1 Area

Note: DPT spacing based on 100 ft spacing for LCP, 50 ft spacing for HCP samples, 25 ft spacing for HS samples, and limited 10 ft spacing for Source Zone.

Office/Admin Building

Area of Subsurface Obstructions

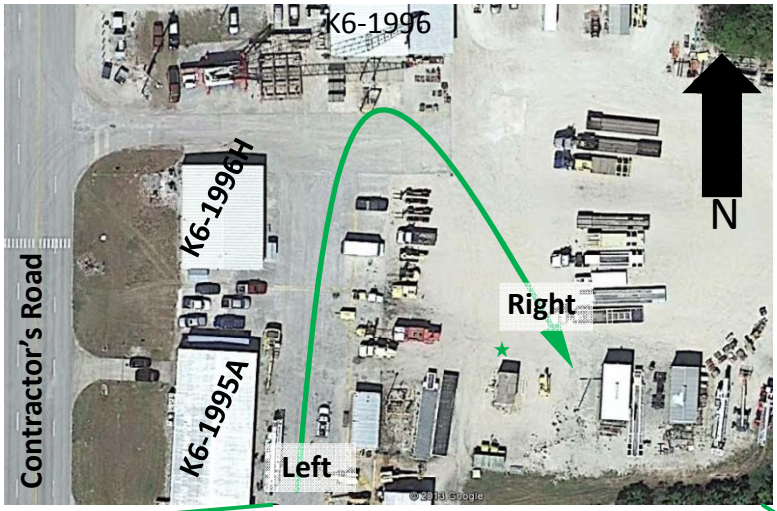
Utility Corridor

# Hot Spot 1 Supplemental Site Assessment

- 1 MIP profile
- DPT groundwater samples in HS1
  - 745 from 94 locations
  - Generally sampled from 16 to 60 ft BLS at 4 ft intervals
  - Some sampling to 70 ft BLS for vertical delineation
- Water level measurements (Mar-12 and July-13)
- Lithology borings to 80 ft BLS (1 within HS1, 1 just west)
- Monitoring well installation and sampling (July-13)
  - deep well (65 to 75 ft BLS) to confirm vertical delineation in source area
- Monitoring well sampling (Mar-12)

# Site Conditions

- Lithology
- Hydrogeologic site characteristics
- Groundwater flow



# Cross Section Plan View

Geosyntec consultants

# Response to Comments

Jacobs-CORE Comment #1: There are 3 soil borings used to generally describe the lithology across the southern portion of the plume (which includes HS1). Only one is within HS1, and it is primarily downgradient (west) of the highest levels of TCE. Consider adding at least one soil boring east of SB06 and DPT72 to ensure the entire area where DNAPL could be present is adequately characterized from a lithology perspective. It would be advantageous to understand in more specific detail the interval between 35 and 50 ft, particularly in evaluating source area treatment technologies.

*Response: Although it is true that only one soil boring is in HS1 area, there were a total of 7 lithology borings advanced across entire site to characterize subsurface lithology. Lithology collected at site to date and presented in this ADP was generally consistent and is adequate for meeting objectives of Step 1 EE; however, potentially collecting additional, focused lithology data in the selected remedial area (depending on selected remedy) may be useful. This additional data can be gathered before the remedy is implemented.*

# Lithology A to A'

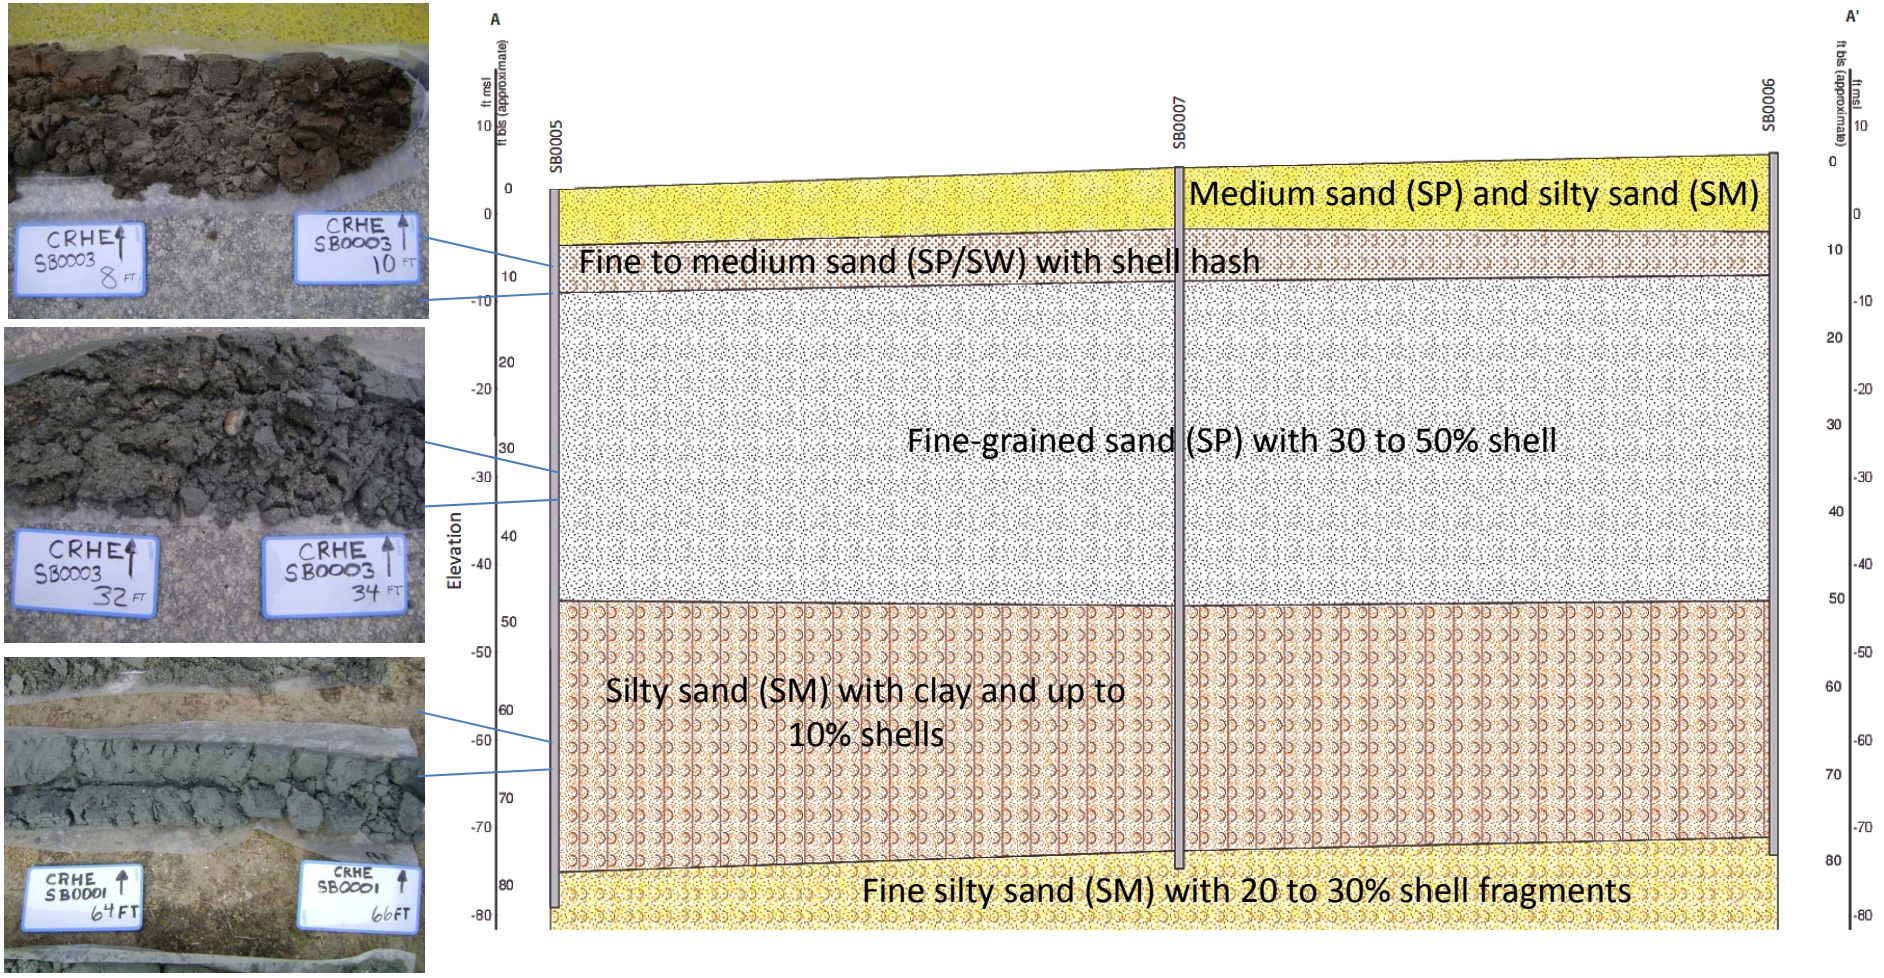


Figure 1

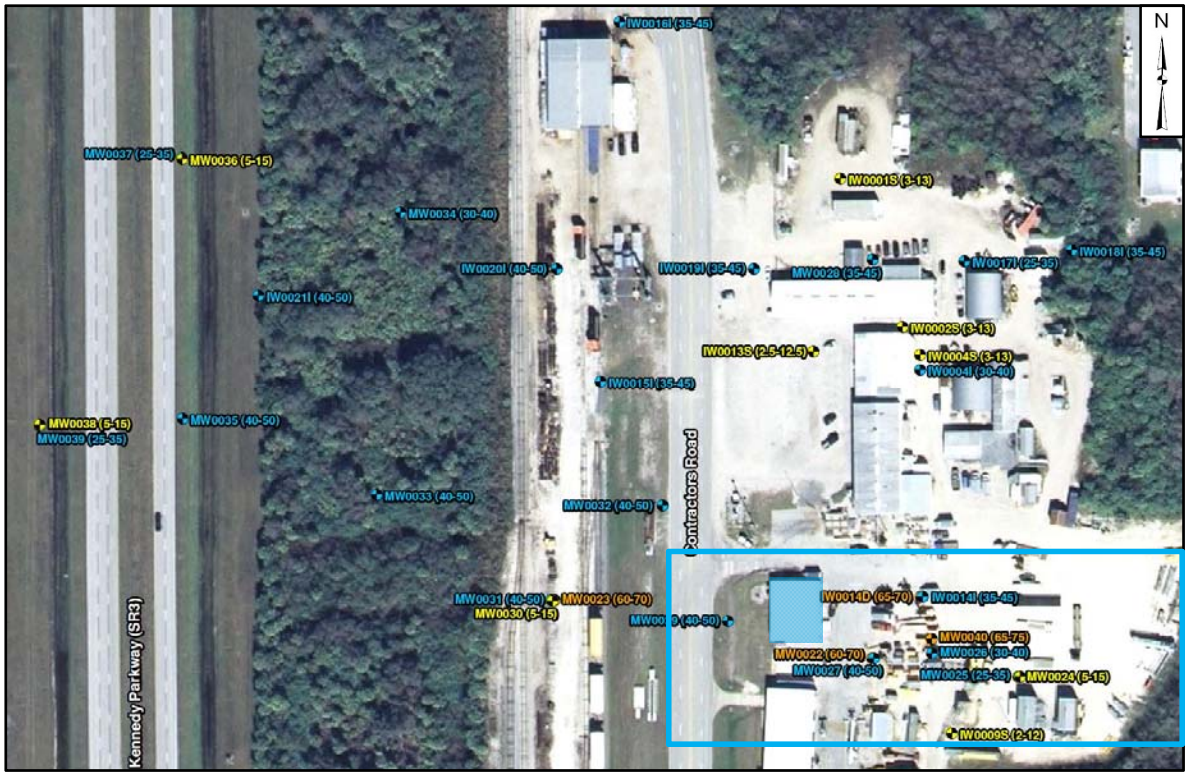
# Response to Comments

Jacobs-CORE Comment #2: Slides 13, 14, 24, 42 – The lithology description shows a fairly consistent fine-grained sand and shell layer from approximately 12 to 50 ft bls; however, the highest levels of TCE are shown in the 36 to 40 ft bls depth range. This indicates something pertinent in or just below this zone, which could be holding DNAPL, and that is discussed on Slide 42. Should that be shown on the lithology drawing (Slide 14)? Again, more detail of this interval would be beneficial in planning and executing any technology which targets the source zone.

*Response: The lithology presented on the cross section (Figure 1) is generalized and the surfaces for lithology transitions were correlated. In SB0006, there are changes in the ratios of sand, shell and clay at 35, 41, and 51 ft BLS. As discussed in a previous response, depending on the selected remedial options, it may be useful to collect additional, focused lithology information in this zone.*

# Current Monitoring Well Network

- 17 shallow (<15 ft BLS) (yellow)
- 23 intermediate (25 to 50 ft BLS) (blue)
- 4 deep wells (>60 ft BLS) (orange)



# Shallow Groundwater Flow – July 2013

Figure 2

Note:

1. Screen interval is presented in feet, below land surface (ft, BLS).
2. Elevation is presented in ft and is referenced to the North American Datum of 1988.

# Response to Comments

TT Comment #1: Slide 16 – The water level MW0024 does not appear to be consistent with the expected potentiometric surface nor do the plumes appear to mimic the easterly directional divide. Is there a suspected cause for the groundwater divide in the region of this well to result in the significant easterly component? Please confirm if this is an anomaly and if MW0025 may be hydraulically communicating with MW0024.

*Response: Historically, shallow gw has been observed to be influenced by wetlands that are to the N, E, and W; therefore, the easterly shallow gw flow is not unexpected.*

*Based on lithology, it is possible that there is a hydraulic connection between MW24 and MW25. MW24 is partially screened in the same unit as monitoring well MW25 (fine grained sand with shell unit).*

*Some of the gw elevations referenced NGVD29 and some NAVD88. The gw elevations were updated to reference NAVD88 and updated gw elevation maps have been provided.*

# Intermediate Groundwater Flow – July 2013

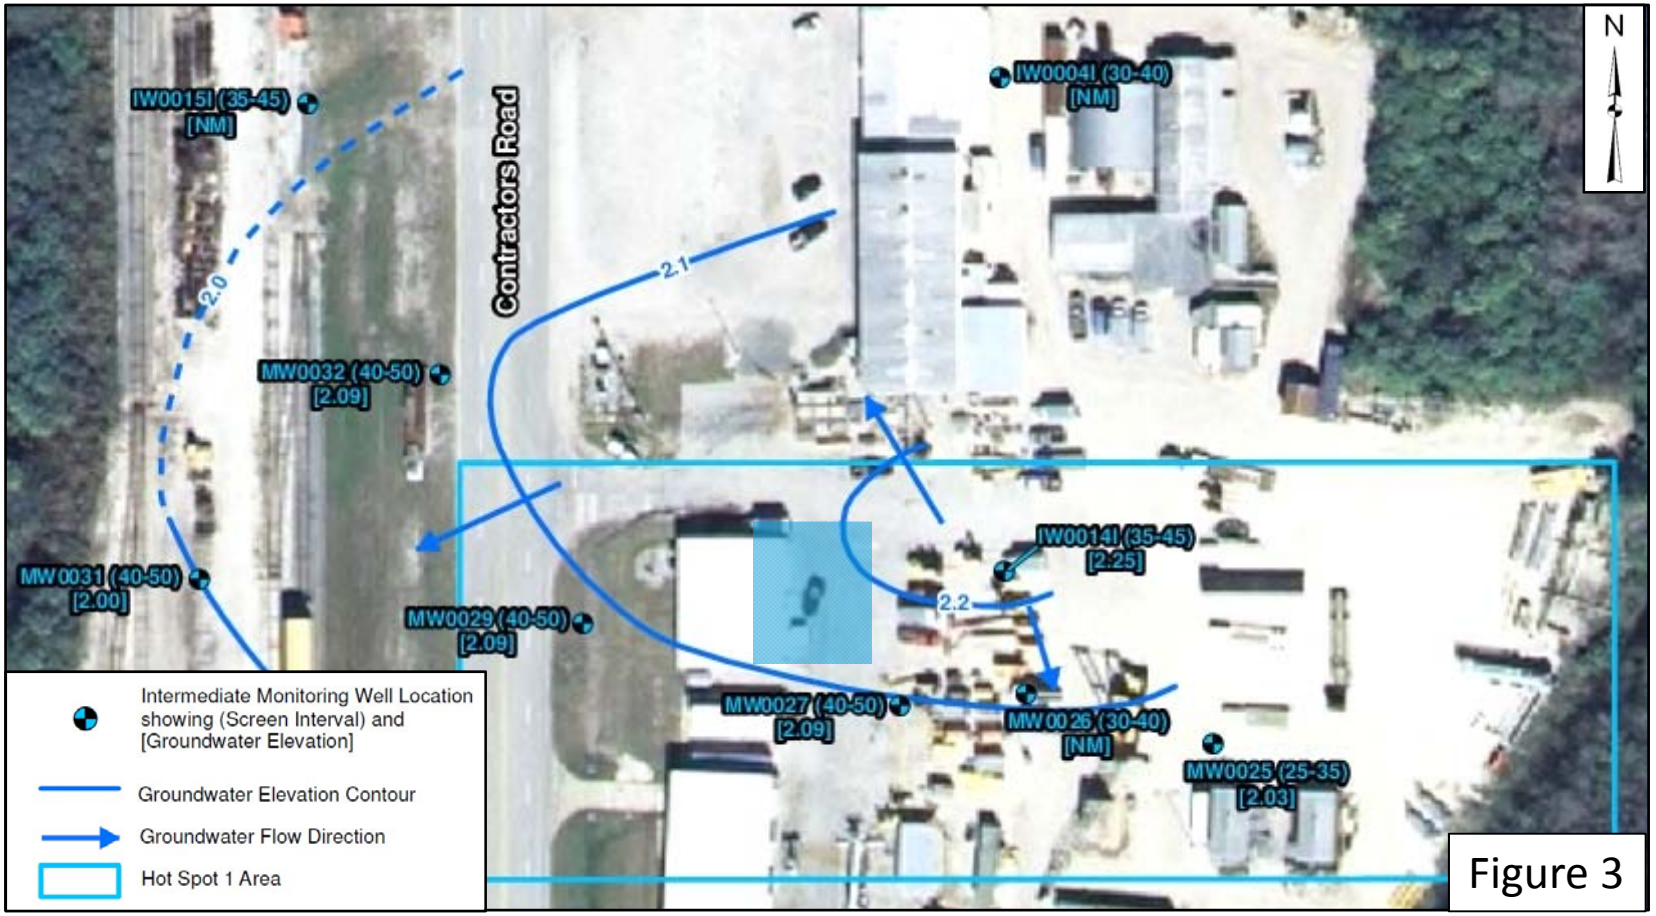


Figure 3

Note:

1. Screen interval is presented in feet, below land surface (ft, BLS).
2. Elevation is presented in ft and is referenced to the North American Datum of 1988.

# Response to Comments

Jacobs-CORE Comment #3: Slide 17 – The shape of the plume generally provides good confirmation of the gradient and gradient trends at a site. The CRHE intermediate groundwater flow map shows a fairly strong southerly component that does not correlate well with the plume configuration. Could the MW0029 measurement be incorrect (possibly a damaged well)?

*Response: It does appear that monitoring well MW29 is controlling the groundwater flow direction, but we feel this is based on the limited number of water levels that were collected, since this effort was focused on HS1. There was no damage observed to the well during the water level collection.*

# Deep Groundwater Flow – July 2013

Figure 4

Note:

1. Screen interval is presented in feet, below land surface (ft, BLS).
2. Elevation is presented in ft and is referenced to the North American Datum of 1988.
3. MW0040 was installed by others but not surveyed. DTW was 2.32 ft BLS but groundwater elevation could not be calculated.

# Hydrogeologic Site Conditions

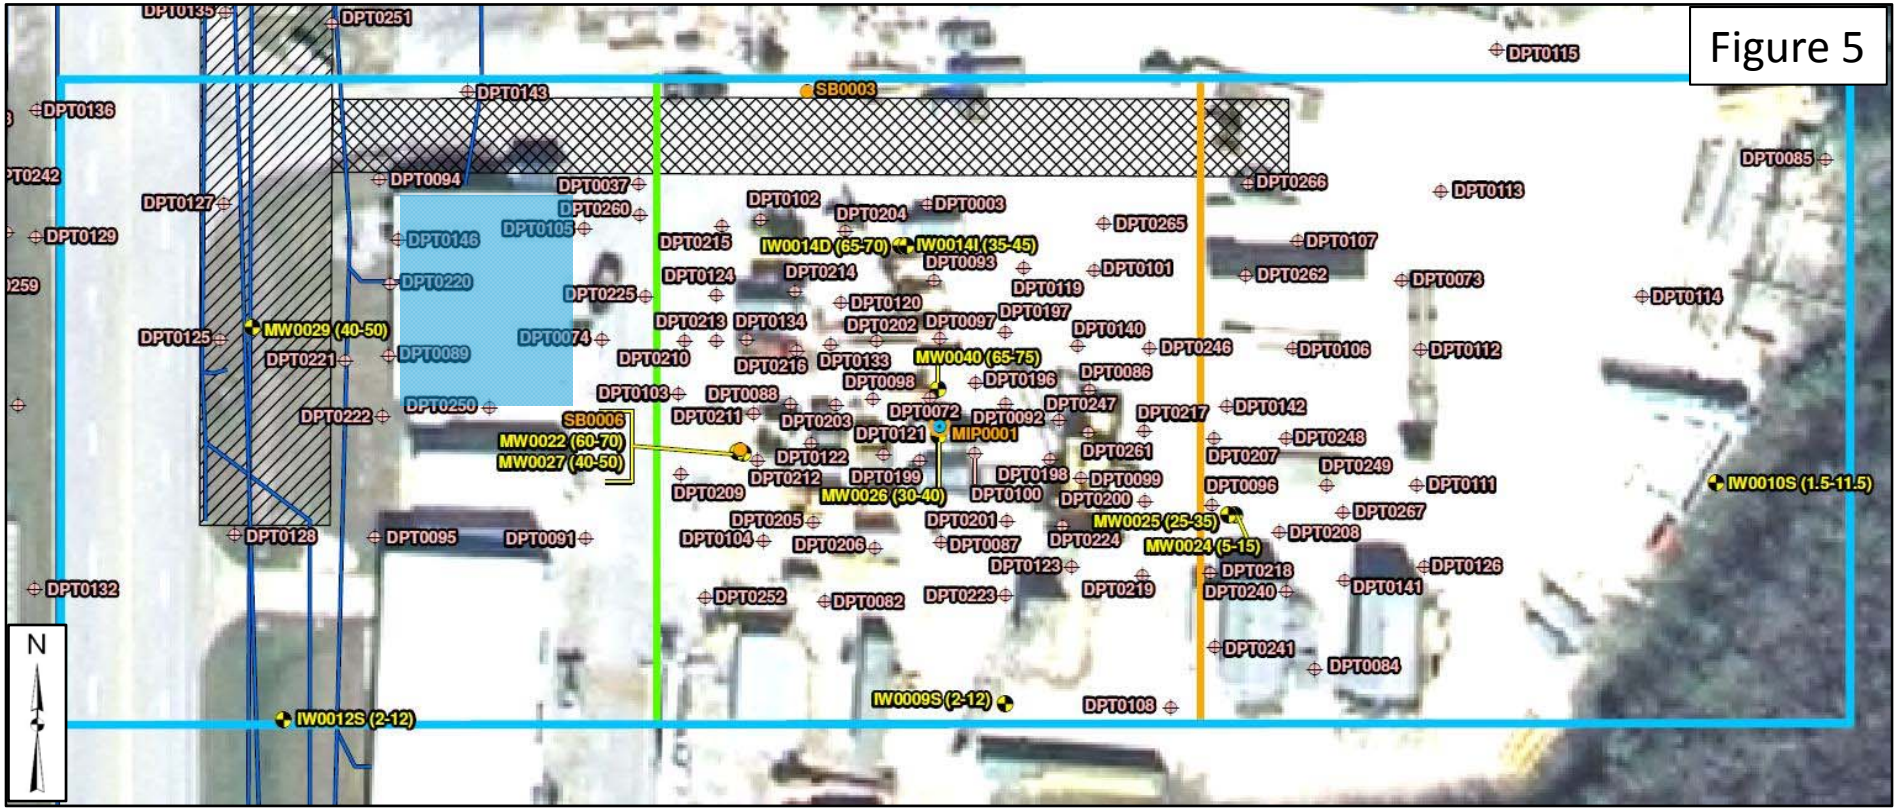
- General groundwater flow direction within HS1
  - Shallow: Variable (west and east components of flow)
  - Intermediate: Generally southwest
  - Deep: Southwest (based on 3 wells in southern portion of site)
- Depth to groundwater 2 to 6 ft BLS
- K of 7.6 ft/d (2,774 ft/yr) from specific capacity tests on shallow and intermediate wells during RFI

| GW Zone | Approx. Depth (ft, BLS) | Av Gradient (ft/ft) | Est. GW Flow Velocity (ft/y) |
|---|---|---|---|
| Shallow | <15 | 0.002 | 28 ft/y* |
| Intermediate | 15 to 55 | 0.005 | 69 ft/y* |
| Deep | >60 | 0.002 | -- |

* Actual groundwater flow velocity is likely highly variable with higher K plume transport intervals and lower K mass storage intervals.

# Sample Locations

Figure 5



Notes:

1. Tag maps included as Figures 6, 7, and 8 (not included in presentation).
2. Sampling not conducted within building because the building functions as administrative space and a conference room. Pending Step 2 technology selection, DPT stepouts can be conducted using angled DPT drilling, if needed.
3. Sample locations could not be cleared in the utility corridor after the early locations were completed (i.e., DPT125 and DPT127).

# Response to Comments

TT Comment #2: Slide 22 – TCE mass consistently seems concentrated from 36 to 45 feet bls. Are there any lithologic or geotechnical variations in this zone that resulted in the majority of mass in this depth interval? Discussion of the site conceptual model from a mass and lithologic standpoint would be a beneficial addition to the CHRE Step 1 EE and downstream remedial decision making.

*Response: The CSM will be discussed from this perspective during the ADP presentation. The lithology borings and MIP log correlate and show a change in lithology at approximately 50 ft BLS. The FID, ECD, and PID results from the MIP log and the DPT sampling results show a majority of the mass is present from 36 to 45 ft BLS. Reviewing the soil boring logs shows that between 30 and 40 ft BLS at the site, the lithology transitions from a sand with ~30% shell to sand with ~50% or more shell. Similar to other sites, the primary high concentration interval maybe associated with an interval of silty sand that is not visible to the eye.*

# Hot Spot 1 Supplemental Site Assessment

- Max concentrations identified in HS1 (µg/L)
  - TCE = 160,000 (DPT72, 36 to 40 ft BLS) (represents 14.5% of TCE solubility; DNAPL likely present)
  - cDCE = 110,000 L (DPT200, 26 to 30 ft BLS) (L=value exceeded calibration range)
  - VC = 19,000 (DPT200, 31 to 35 ft BLS)
- Source Zone defined as 11,000 µg/L (1% TCE solubility) because this represents the area where DNAPL could be present
- ½ detection limit was used for contouring purposes for ND values

(Only locations with results > 1.0 U are labeled)

# Response to Comments

Jacobs-CORE Comment #4: Slides 26 and 44 to 46 – Minor comment, but from a remediation perspective it seems prudent to assume that the area between DPT0098 and DPT0216 is above 1% solubility (contoured purple). The same could be considered for the area between DPT0247 and DPT0196, along with the area between DPT0134 and DPT0225. Again, this is just from a remediation perspective based upon the potential error in sampling in these high concentration areas, but it affects the SZ area shown on Slides 44 – 46, and also would affect the size and planning of any SZ remediation alternative.

*Response: We concur that the 1% solubility areas could be combined into one area for purposes of the Step 2 and Step 3 EE.*

(Only locations with results > 1.0 U are labeled)

# Response to Comments

TT Comment #3: Slide 27 – Elevated TCE results are present in DPT0196, 0202, 0225, and 0247 within the 41 to 45 feet bls sampling interval, and these locations were not sampled within the 46 to 50 feet bls interval. Please confirm if this is a vertical data gap since a sampling point is not present between 45 to 56 feet bls with moderate detections from 56 to 60 feet bls.

*Response: We do not feel that this is a data gap. There is a high density of data in each depth zone in HS1, although, as identified, toward the end of the sampling effort, sampling intervals were focused based on the previous results. Also, sampling at depth in these locations was discontinued because of the concern for dragdown and with the understanding that a vertical delineation well would be installed and sampled (MW40).*

# View 4dim EVS Files

Note: In the EVS model, ½ detection limit was used for ND values.

# Response to Comments

TT Comment #4: Slide 41 (EVS) – When viewing the plume intervals, it is difficult to interpret internal zones (e.g., HS and SZ) due to the large thickness of data points. Suggest minimizing or showing as a discrete point within the middle of the sample interval. Review of the SZ in EVS was not completed due to this interference. Additionally, the deep interval bottom does not appear to be vertically delineated via EVS visual inspection.

*Response: The EVS models were revised several times with this concern in mind. The EVS model was provided for each COC with the focus on HS1 area only, and then with the entire site shown. The locations with concentrations<GCTL were made transparent to make the area with high concentrations easier to view. We do not feel it is necessary to revise the EVS model. Additionally, the SZ was delineated with a permanent deep well (MW40) near the highest observed TCE concentrations at the site.*

# Supplemental Assessment/ Delineation Summary

- Impacts generally from 8 to 50 ft BLS
- Max concentrations (µg/L)
  - TCE = 160,000 (DPT72, 36 to 40 ft BLS)
  - cDCE = 110,000 L (DPT200, 26 to 30 ft BLS)
    - L indicates the value exceeded the calibration range
  - VC = 19,000 (DPT200, 31 to 35 ft BLS)
- SZ contaminant mass is mainly 30 to 46 ft BLS (60% of mass in that zone within 36 to 40 ft BLS)
- Lithology
  - primarily sand until ~45 to 50 ft BLS (based on visual observations, MIP, and DPT data)
  - below ~ 45 to 50 ft BLS, lithology is silty sand, with varying amounts of clay (semi-confining layer)
- MW40 installed to evaluate potential dragdown in source area DPTs and results confirmed vertical delineation

# Contaminant Mass Evaluation

| Constituent | Depth Interval (ft) | Average Concentration (µg/L) | Pore Volume (L) | Equilibrium Soil Conc. (mg/kg) | Dissolved Mass (lbs) | Sorbed Mass (lbs) | Total Mass (lbs) |
|---|---|---|---|---|---|---|---|
| TCE | 0 to 16 | 5.4 | 7.87E+04 | 0.003 | 0.001 | 0.003 | 0.004 |
| | 16 to 30 | 40 | 8.50E+05 | 0.02 | 0.07 | 0.2 | 0.3 |

| | 321 | EVS Estimate | --- | --- | 1.13E+06 | 0.8 | 0.02 | 0.4 | 1.2 |
| VC > 1,000 µg/L | 3,672 | Hand Calculated | 18,731 | 15 | 1.99E+06 | 16 | 0.28 | 7.8 | 24 |
| | 2,375 | EVS Estimate | --- | --- | 5.99E+05 | 3.1 | 0.18 | 1.5 | 4.7 |
| | | | | | **Total Dissolved Mass** | **4.2 to 21 lbs** | **Total Sorbed Mass** | **2 to 10 lbs** | |
| | | | | | | | **Total VC Mass** | **6.2 to 31.1 lbs** | |
| | | | | | | | **Total Mass** | **27 to 223 lbs** | |

**Notes:**

1. Pore volume for EVS calculations was estimated via EVS and for the hand calculations was estimated using area and depth provided assuming a porosity of 0.25.
2. Soil density assumed to be 100 $lb/ft^3$.
3. Foc assumed to be 0.003 which was taken from estimate provided by Tetra tech in Step 1 ADP for Hot Spot 2 for a sand with shell.
4. Koc data calculated from Sawyer, McCarty and Parkin, 5th Edition (2002); TCE = 165.7 L/kg, cDCE = 45.6 L/kg and VC = 26.3 L/kg.

# Response to Comments

TT Comment #5: Slide 43/44 – TT does not agree with the methodology used for the mass calculation and the interpretation of the CSM. The mass is also not in agreement to the previous Step 1A EE. Applying an average concentration over the entirety of the plume area and not within specific isoconcentration intervals does not seem appropriate. The averaging methods used appear to have resulted in a misrepresentation of an average concentration and mass that is skewed low. Based on the information provided within the Step 1 EE, we would anticipate the TCE mass to be higher. Please revisit the mass calculation and revise the Part B technology screening as a result of the revision, where appropriate.

*Response: The mass calculation was performed using two different methods, both of which used the average concentrations for the specific isoconcentrations (e.g., NADC >COC>GCTL, 10XNADC>COC>NADC). One was performed by depth interval and one for the overall plume (as concentric rings not averaged over the entirety of the plume). The average concentrations presented were calculated by hand and by EVS. The mass calculations consistently documented a similar mass estimate within the same order of magnitude. We believe the multiple approaches used and similarity in results provides a reasonable estimate of mass. No revisions are warranted.*

# Response to Comments

TT Comment #1B: Slide 58 – Given the suspected under allocation of mass at CRHE, we do not concur to the Source Zone remedial technologies retained until the contaminant mass calculation and distribution is revised and redistributed to the team.

*Response: See previous response, additional information was provided regarding the mass calculations. We believe that the information presented is adequate to make a decision regarding retained remedial technologies.*

# Response to Comments

Jacobs-CORE Comment #5: Slides 43/44 – Both slides note that DNAPL mass was not considered in estimating contaminant mass. What is the rationale for excluding DNAPL from the mass estimate? Consider developing mass estimates for the SZ and HS independently (including DNAPL mass), then adding those to the gross average of the remaining HCP and LCP.

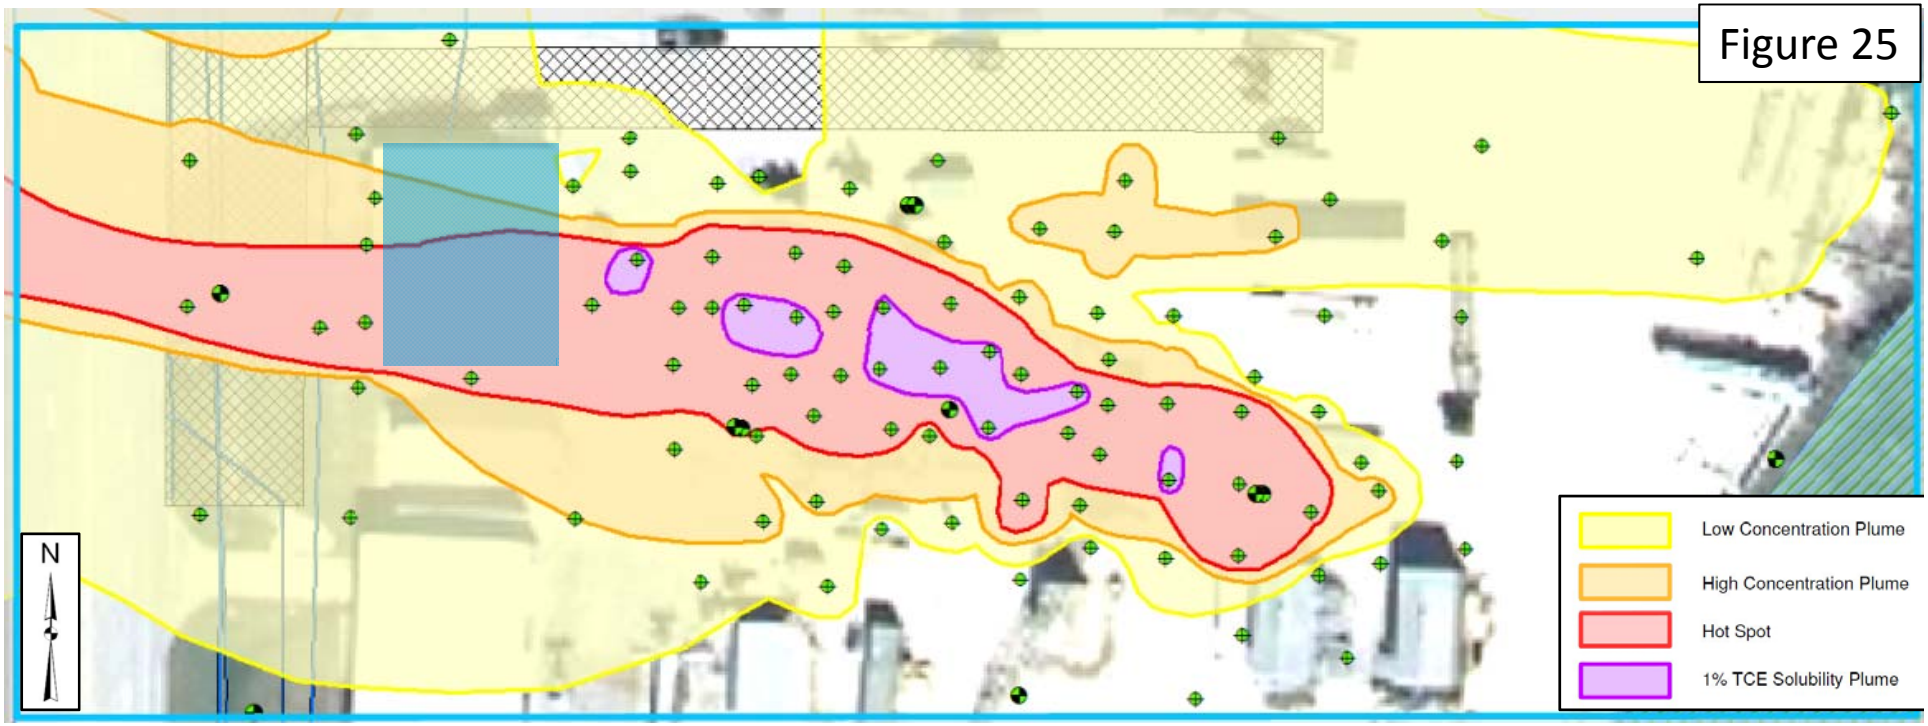
*Response: The note was intended to indicate that a specific quantity of DNAPL product at 12.2 lb/gallon density was not considered to occupy some assumed fraction of pore spaces over some assumed area and assumed thickness. We considered the sorbed mass partitioned fraction to account for DNAPL (ganglia and/or limited sorbed form present). Estimating DNAPL mass at a site is difficult, even with high resolution gw sampling data. If it is assumed that DNAPL occupies 0.01 to 0.1% of pore space (of 1% solubility area), there would be ~0.45 to 4.5 gallons of TCE DNAPL, which is ~5.5 to 55 lbs of DNAPL. Regardless of absence/presence and/or form of DNAPL, the overall mass estimate provides a reasonable order of magnitude estimate of mass likely present in HS1.*

# Potential Treatment Areas

- SZ (1% TCE solubility)
  - 0.04 acres
  - Represents about 1 to 26 lbs of total mass
  - ~4 to 12% of total mass
- CVOCs > 10xNADC
  - 0.43 acres
  - Represents about 16 to 147 lbs of total mass
  - ~59 to 66% of total mass
- Max treatment depth of 50 ft BLS
  - 97% of mass above this depth
  - semi-confining layer at this depth

# Overall Hot Spot 1 Area

Figure 25



| Plume Within HS1 | Area (acres) |
|---|---|
| LCP (>GCTL) | 1.99 |
| HCP (>NADC) | 0.78 |
| Hot Spot (>10xNADC) | 0.43 |
| SZ (> 11,000 µg/L TCE; 1% solubility) | 0.04 |

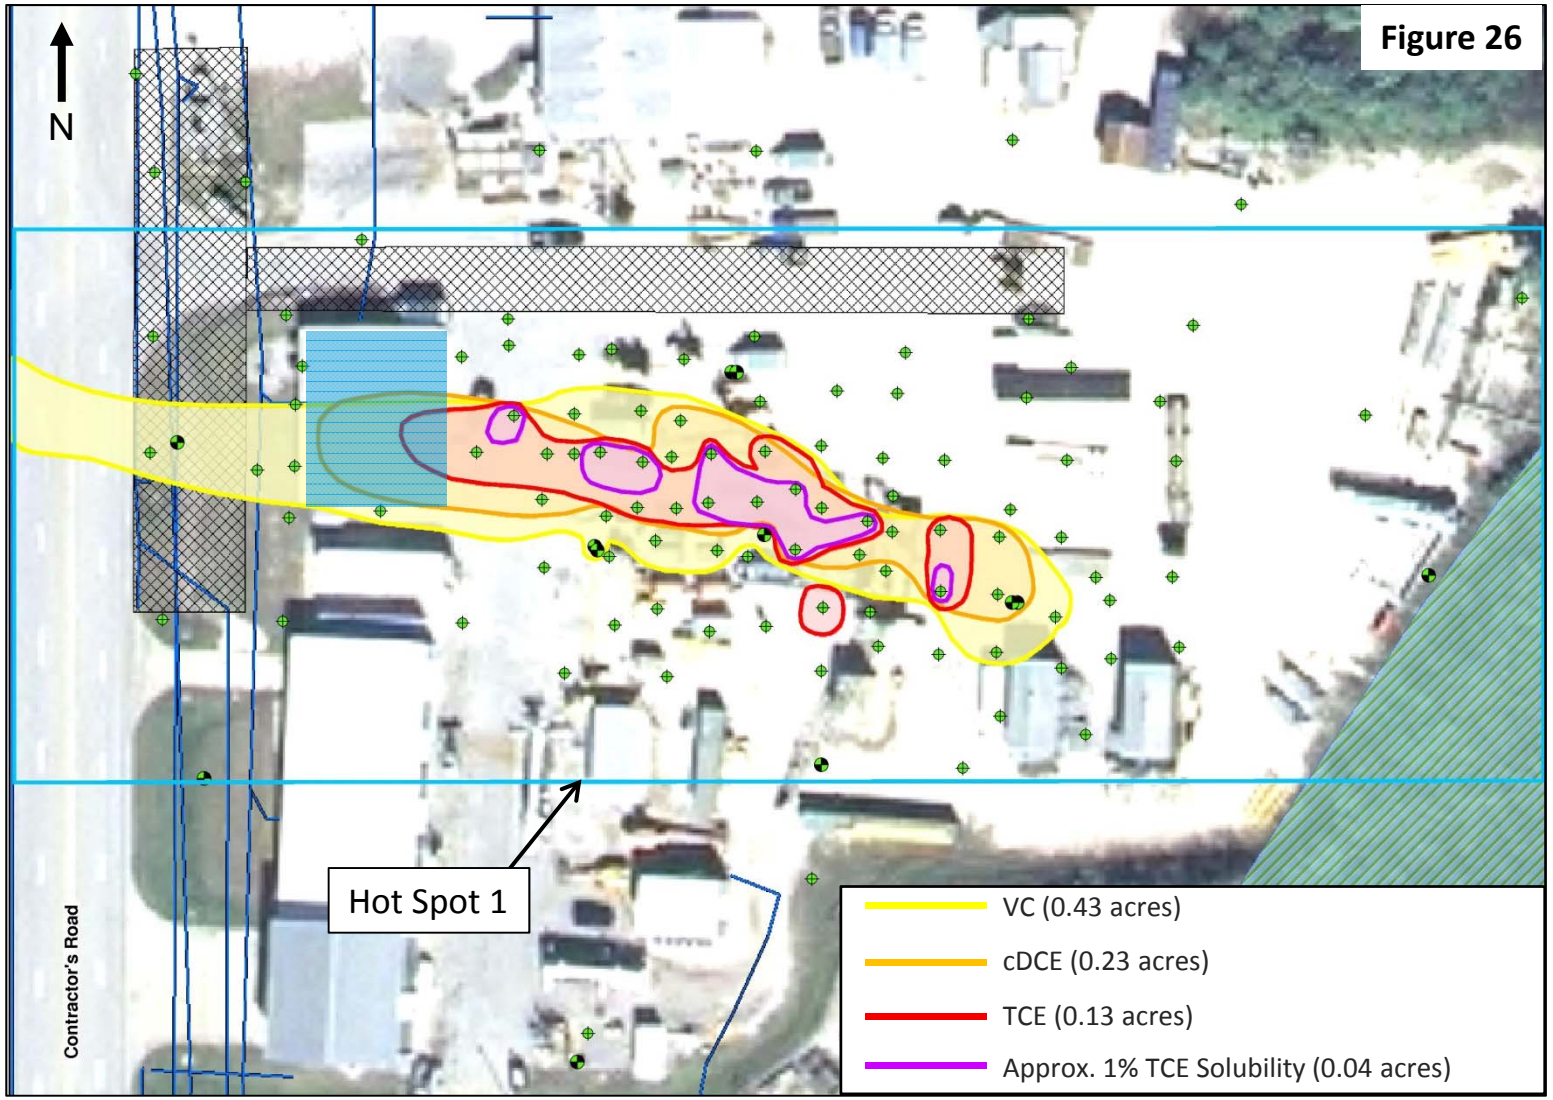
# Test Consensus - Step 1A

- Delineation in HS1 is complete for:
  - Source Zone (TCE greater than 11,000 µg/L)
  - Hot Spot (TCE and cDCE greater than 10xNADC)
  - HCP (concentration of TCE greater than NADC)
  - LCP (concentration of TCE greater than GCTL)
- cDCE HCP and LCP plumes are co-mingled with adjacent HS areas; delineation within HS1 is complete
- VC Hot Spot, HCP and LCP plumes are co-mingled with adjacent HS areas; delineation within HS1 is complete

# Step 1 – Section B

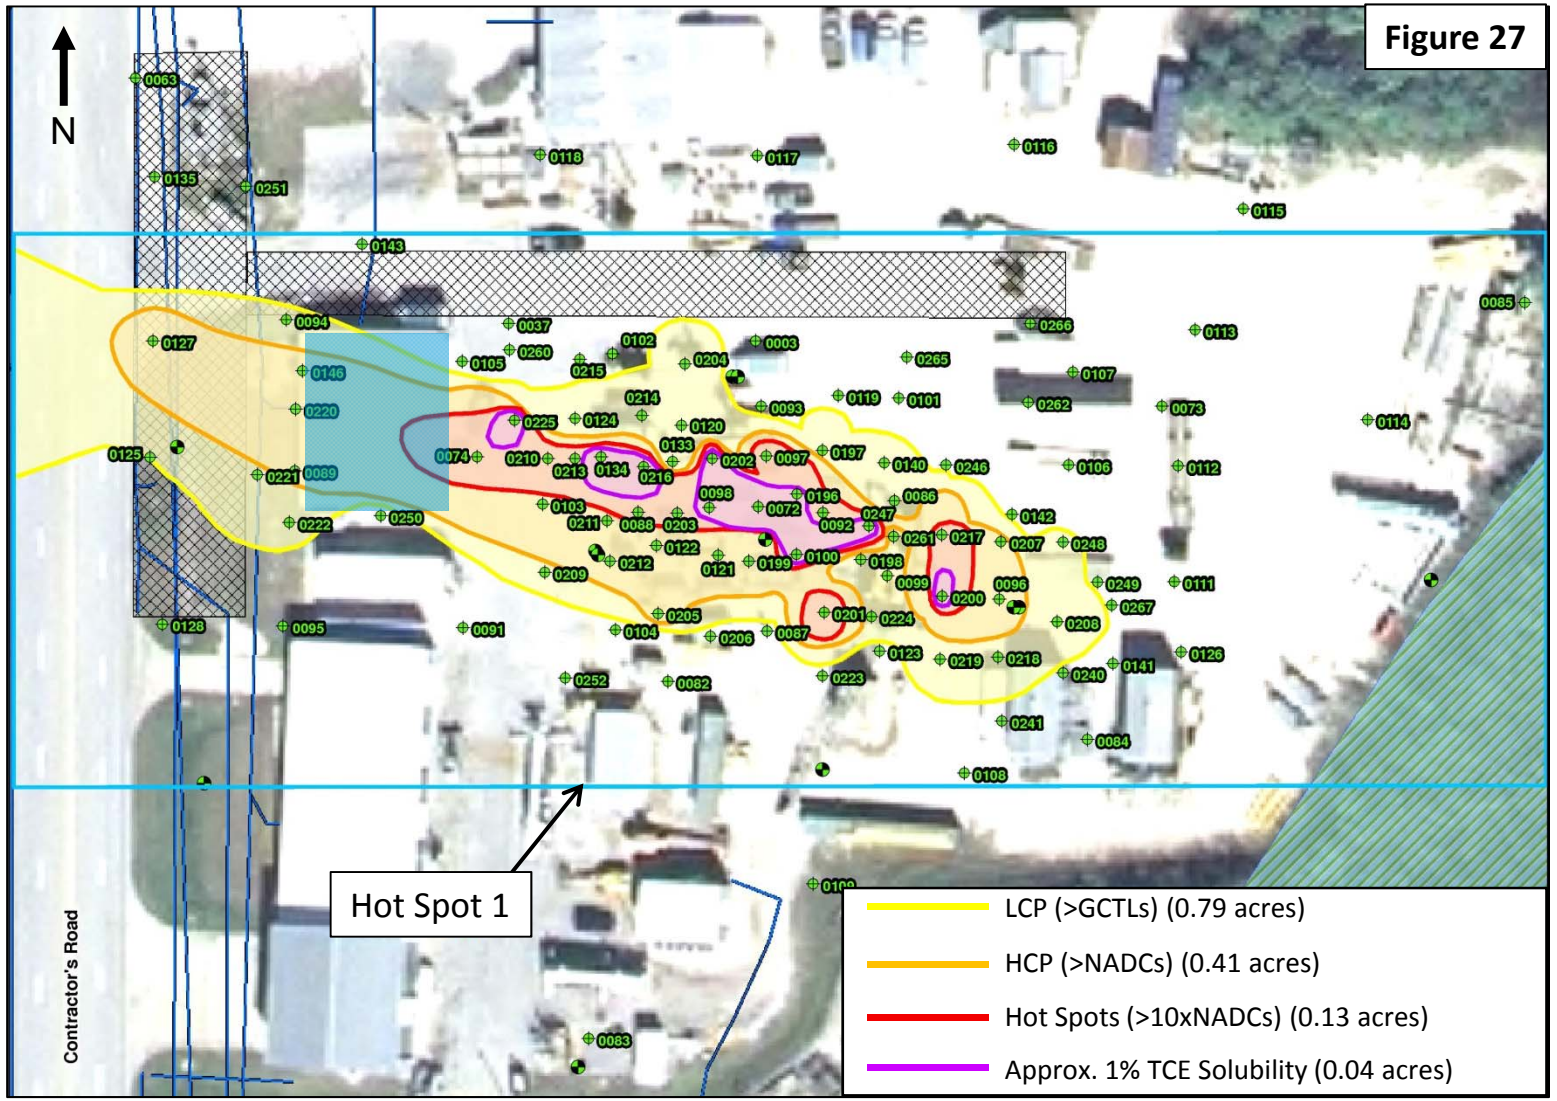
Geosyntec consultants

# 10x NADC Plumes Hot Spot 1



# Overall TCE Plume Hot Spot 1

Figure 27



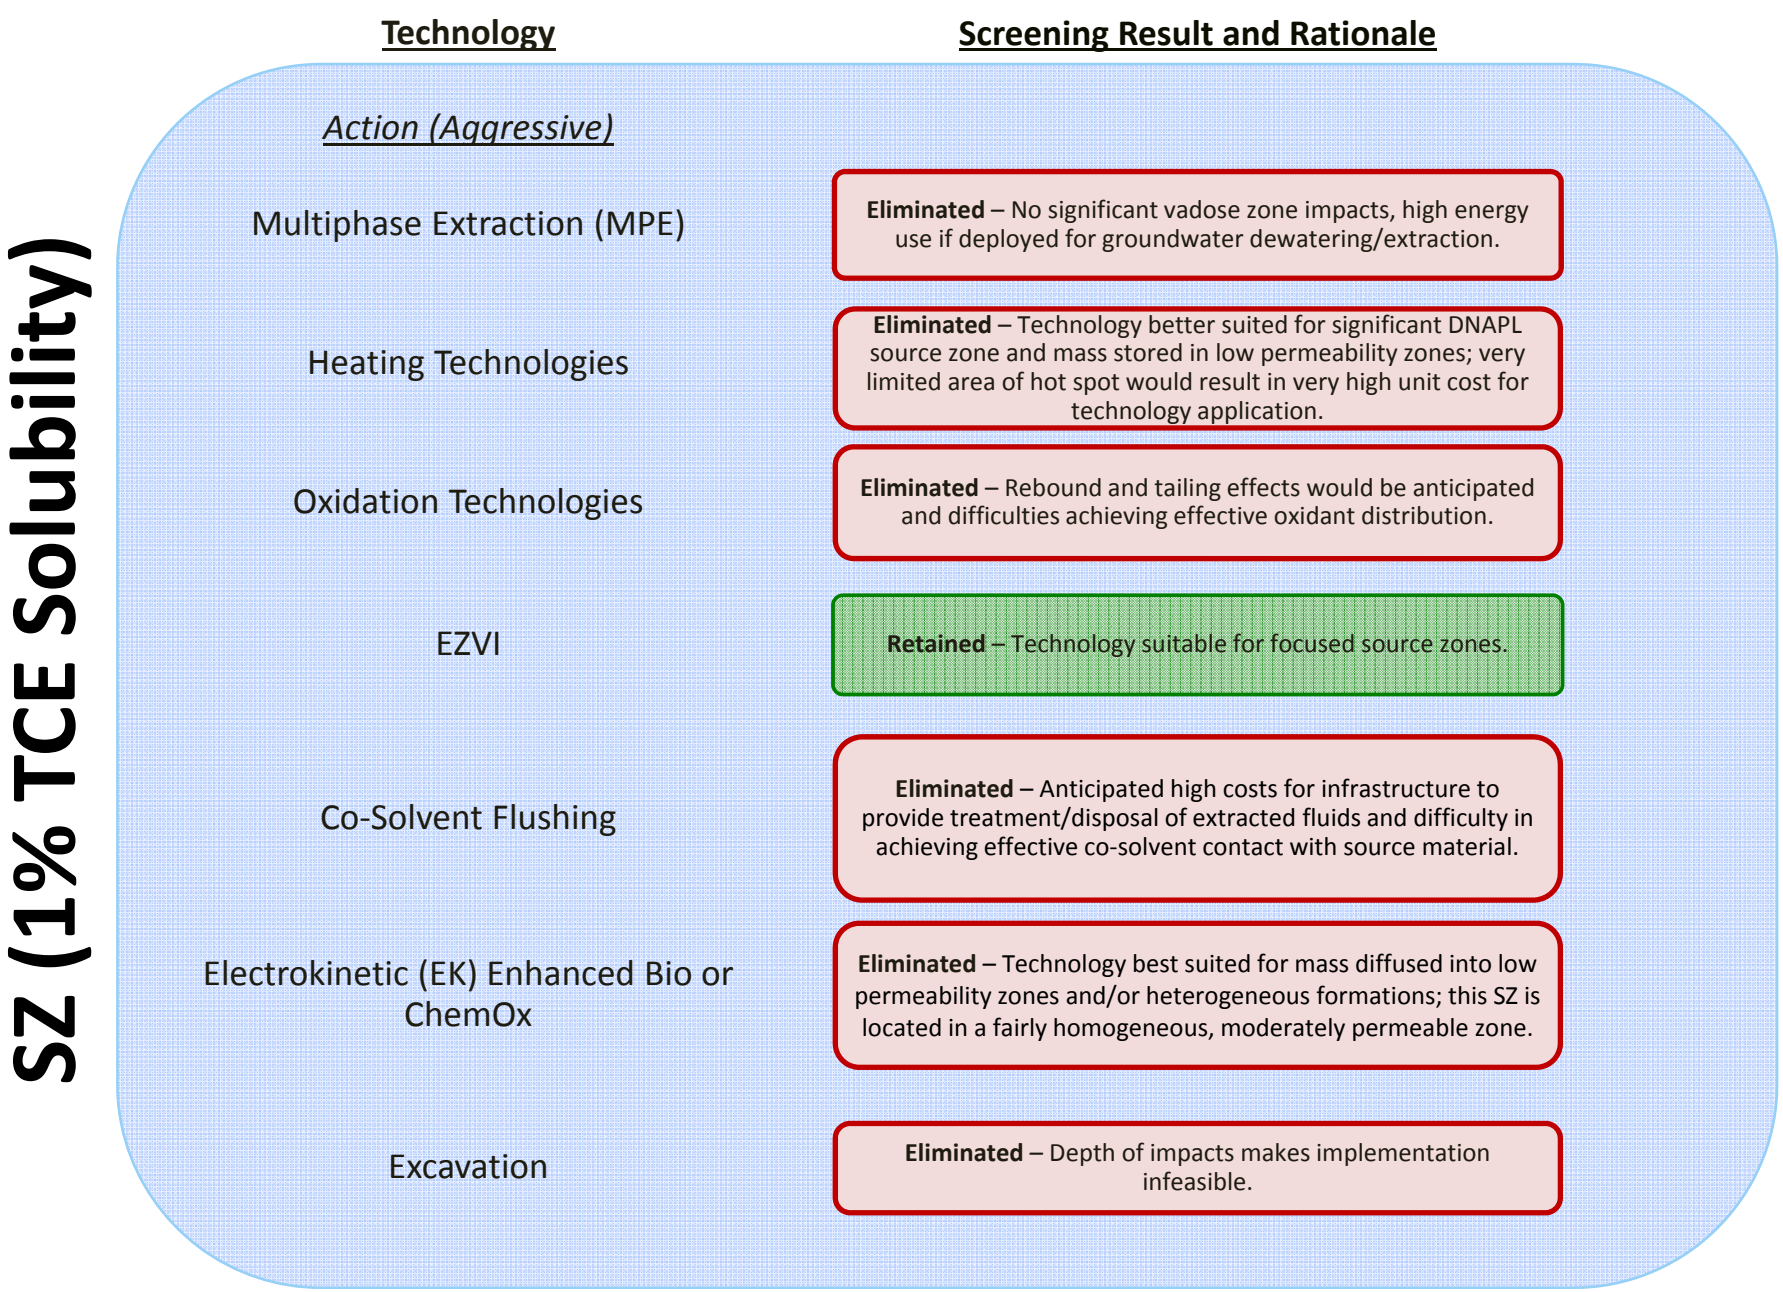
Geosyntec consultants

# Review of Pertinent Site Conditions

- Buildings/site structures and large equipment storage
- Downgradient edge of 10x NADC is under building
- HS1 area is mostly gravel/concrete
- Impacts generally present from 8 to 50 ft BLS
  - SZ contaminant mass is mainly 36 to 40 ft BLS
- Lithology is primarily sand until approximately 45 to 50 ft BLS (based on visual observations, MIP, and DPT data)
  - Below approximately 45 to 50 ft BLS lithology is silty sand, with varying amounts of clay (semi-confining layer)

# SZ (1% TCE Solubility)

| Technology | Screening Result and Rationale |
|---|---|
| *No Action* | |
| No Further Action | **Eliminated** – Not protective of human health and environment or allowed from a regulatory perspective. |
| *Limited Action (Passive)* | |
| Institutional Controls | **Retained** – Facility Land Use Controls warranted to prevent exposure to groundwater and/or installation of potable wells. |
| Monitoring (LTM, MNA) | **Eliminated** – Not protective of human health and environment or allowed from a regulatory perspective unless in conjunction with another technology. |
| *Action (Aggressive)* | |
| GW Extraction (Hydraulic Containment, pump and treat) | **Conditionally Retained** – Only suitable for plume containment and/or as a component of another aggressive treatment technology. |
| Impermeable Barrier | **Eliminated** – Not feasible due to site features (buildings, roads and railroad tracks); multiple discrete areas. |
| Bioremediation (Bioaugmentation, Biostimulation) | **Retained** – Reductive dechlorination occurring at site based on cDCE and VC production, but would require additional data. |
| Large Diameter Auger (LDA) (solidification, steam, EZVI approaches) | **Eliminated** – Technology better suited for significant DNAPL source zone and mass stored in low permeability zones; based upon site features and very limited footprint of SZ impacts, will likely result in very high unit costs. |
| Air Sparge | **Retained** – Effective treatment above semi-confining layer (~50 ft BLS) for volatilization of CVOCs. |



SZ (1% TCE Solubility)
Technology
Screening Result and Rationale
Action (Aggressive)
Multiphase Extraction (MPE)
Eliminated – No significant vadose zone impacts, high energy use if deployed for groundwater dewatering/extraction.
Heating Technologies
Eliminated – Technology better suited for significant DNAPL source zone and mass stored in low permeability zones; very limited area of hot spot would result in very high unit cost for technology application.
Oxidation Technologies
Eliminated – Rebound and tailing effects would be anticipated and difficulties achieving effective oxidant distribution.
EZVI
Retained – Technology suitable for focused source zones.
Co-Solvent Flushing
Eliminated – Anticipated high costs for infrastructure to provide treatment/disposal of extracted fluids and difficulty in achieving effective co-solvent contact with source material.
Electrokinetic (EK) Enhanced Bio or ChemOx
Eliminated – Technology best suited for mass diffused into low permeability zones and/or heterogeneous formations; this SZ is located in a fairly homogeneous, moderately permeable zone.
Excavation
Eliminated – Depth of impacts makes implementation infeasible.

# Response to Comments

Jacobs-CORE Comment #1B: Slide 53 (SZ Technology Screening) – Regarding elimination of LDA as an alternative. True that the SZ area is small which could make it cost prohibitive for LDA, but this area is totally accessible and, considering performance of LDA projects locally that have shown >95% efficiency over time, it may be worth considering since the likelihood of enhanced effectiveness could out-weigh the negative aspect of a higher cost. At a minimum, it would be nice to understand costs associated with LDA compared to other technologies, especially considering the performance.

*Response: We do not feel that LDA is an appropriate technology for this site based on the following: (i) the technology is better suited for source zones with significant DNAPL mass and mass stored in low permeability zones; (ii) access at the site is difficult due to buildings and storage of large pieces of equipment and conex boxes; and (iii) settling at the site after LDA implementation could result in damage to buildings or loss of storage area for the facility.*

# Response to Comments

Jacobs-CORE Comment #2B: Slide 53 (SZ Technology Screening) – AS Retained: It is evident that there is a low permeable zone somewhere around 40 ft bls which is possibly holding DNAPL. Will AS be able to effectively permeate through this zone and access the source mass that may be dispersed in diffusion limited zones? This has historically been an issue with sites that rebound following the use of pump and treat and air sparge technologies. If you have already compared the CRHE lithology to other sites where AS is effective and found that the CRHE lithology is favorable, a statement to that effect would be helpful. If not, the additional lithologic boring suggested above would be helpful, or consider whether a pilot test is needed.

*Response: The lithology borings did not indicate any low permeability zone above ~50 ft BLS. We do believe that AS will effectively treat mass at this site if the system is installed and operated properly. Additional soil borings can be collected as part of the Step 3 EE to assure the sparge screens are set in the appropriate locations.*

# Hot Spot 1 (>10xNADCs)

| Technology | Screening Result and Rationale |
|---|---|
| *No Action* | |
| No Further Action | **Eliminated** – Not protective of human health and environment or allowed from a regulatory perspective. |
| *Limited Action (Passive)* | |
| Institutional Controls | **Retained** – Facility Land Use Controls warranted to prevent exposure to groundwater and/or installation of potable wells. |
| Monitoring (LTM, MNA) | **Eliminated** – Not protective of human health and environment or allowed from a regulatory perspective unless in conjunction with another technology. |
| *Action (Aggressive)* | |
| GW Extraction (Hydraulic Containment, pump and treat) | **Conditionally Retained** – Only suitable for plume containment and/or as a component of another aggressive treatment technology. |
| Impermeable Barrier | **Eliminated** – Not feasible due to site features (buildings, roads and railroad tracks); multiple discrete areas. |
| Bioremediation (Bioaugmentation, Biostimulation) | **Retained** – Reductive dechlorination occurring at site based on cDCE and VC production, but would require additional data. |
| Large Diameter Auger (LDA) (solidification, steam, EZVI approaches) | **Eliminated** – Not feasible due to site features – buildings, roads and railroad tracks. |
| Air Sparge | **Retained** – Effective treatment above semi-confining layer (~50 ft BLS) for volatilization of CVOCs. |

# Hot Spot 1 (>10xNADCs)

| Technology | Screening Result and Rationale |
|---|---|
| *Action (Aggressive)* | |
| Multiphase Extraction (MPE) | **Eliminated** – No significant vadose zone impacts, high energy use if deployed for groundwater dewatering/extraction. |
| Heating Technologies | **Eliminated** – Technology better suited for significant DNAPL source zone and mass stored in low permeability zones; very limited area of hot spot would result in very high unit cost for technology application. |
| Oxidation Technologies | **Eliminated** – Rebound and tailing effects would be anticipated and difficulties achieving effective oxidant distribution. |
| EZVI | **Eliminated** – Technology better suited for focused DNAPL source zones not dissolved CVOCs. |
| Co-Solvent Flushing | **Eliminated** – Technology better suited for focused DNAPL source zones. |
| Electrokinetic (EK) Enhanced Bio or ChemOx | **Eliminated** – Technology better suited for focused uniform distribution of e-donor, microbial culture, or oxidant in limited footprint areas with high level of heterogeneity and diffused mass/DNAPL in low permeability zones. |
| Excavation | **Eliminated** – Depth of impacts makes implementation infeasible. |

# Engineering Data Gaps

- Additional data to evaluate bioremediation
  - Sample four intermediate wells down plume centerline and across site
    - MW25 (25-35)
    - MW29 (40-50)
    - MW35 (40-50)
    - MW19I (35-45)
  - Analyze samples for the following parameters
    - MEEs, sulfate, sulfide
    - Dhc and vcrA
    - VOCs including Freon 113
    - 1,4-Dioxane
- Evaluate existing electric service for air sparging

# Response to Comment

TT General Comment #7 Was 1,4-dioxane sampled at CRHE? If so, please include in ADP.

*Response: Select site monitoring wells were sampled and analyzed for 1,4-dioxane in 1997. The sample results were all non-detect (500 U and 2,500 U µg/L), but with DLs>FDEP GCTL (3.2 µg/L). It is proposed that samples collected from wells that will be sampled to collect additional data to evaluate bioremediation (MW0025, MW0029, MW0035 and MW0019I), will be analyzed for 1,4-dioxane.*

# Engineering Data Gap Proposed Sampling Locations

# Retained Technologies

## SZ (>1% TCE solubility)

- Retained technology
  - Institutional controls
  - Bioremediation
  - Air sparging
  - EZVI
- Conditionally retained
  - Groundwater extraction in combination with bioremediation

## Hot Spots (>10x NADC)

- Retained technology
  - Institutional controls
  - Bioremediation
  - Air sparging
- Conditionally retained
  - Groundwater extraction in combination with bioremediation

Air sparge and bioremediation are scalable to larger treatment areas

# Response to Comments

Jacobs-CORE Comment: Slide 58 – Air Sparge and Bioremediation are listed as scalable to larger treatment areas. Please confirm that other combined technologies, such as EZVI and Bioremediation, will also be looked at for scaling to larger zones.

*Response: EZVI was only recommended for evaluation in the area with TCE concentrations greater than 1% solubility. EZVI will not be considered for scaling to larger zones due to the elevated cost which would be anticipated in a larger area.*

# Path Forward/Test Consensus

- Proceed to Step 2
- Presumptive interim GW monitoring for LCP and HCP
- Separate evaluations for retained technologies
  - SZ (1% TCE solubility)
  - CVOCs > 10xNADC
- Test consensus
  - 1% solubility (11,000 µg/L) TCE as SZ
  - Technologies retained for evaluation in Step 2
  - Possibility to scale bioremediation and air sparging to larger treatment area

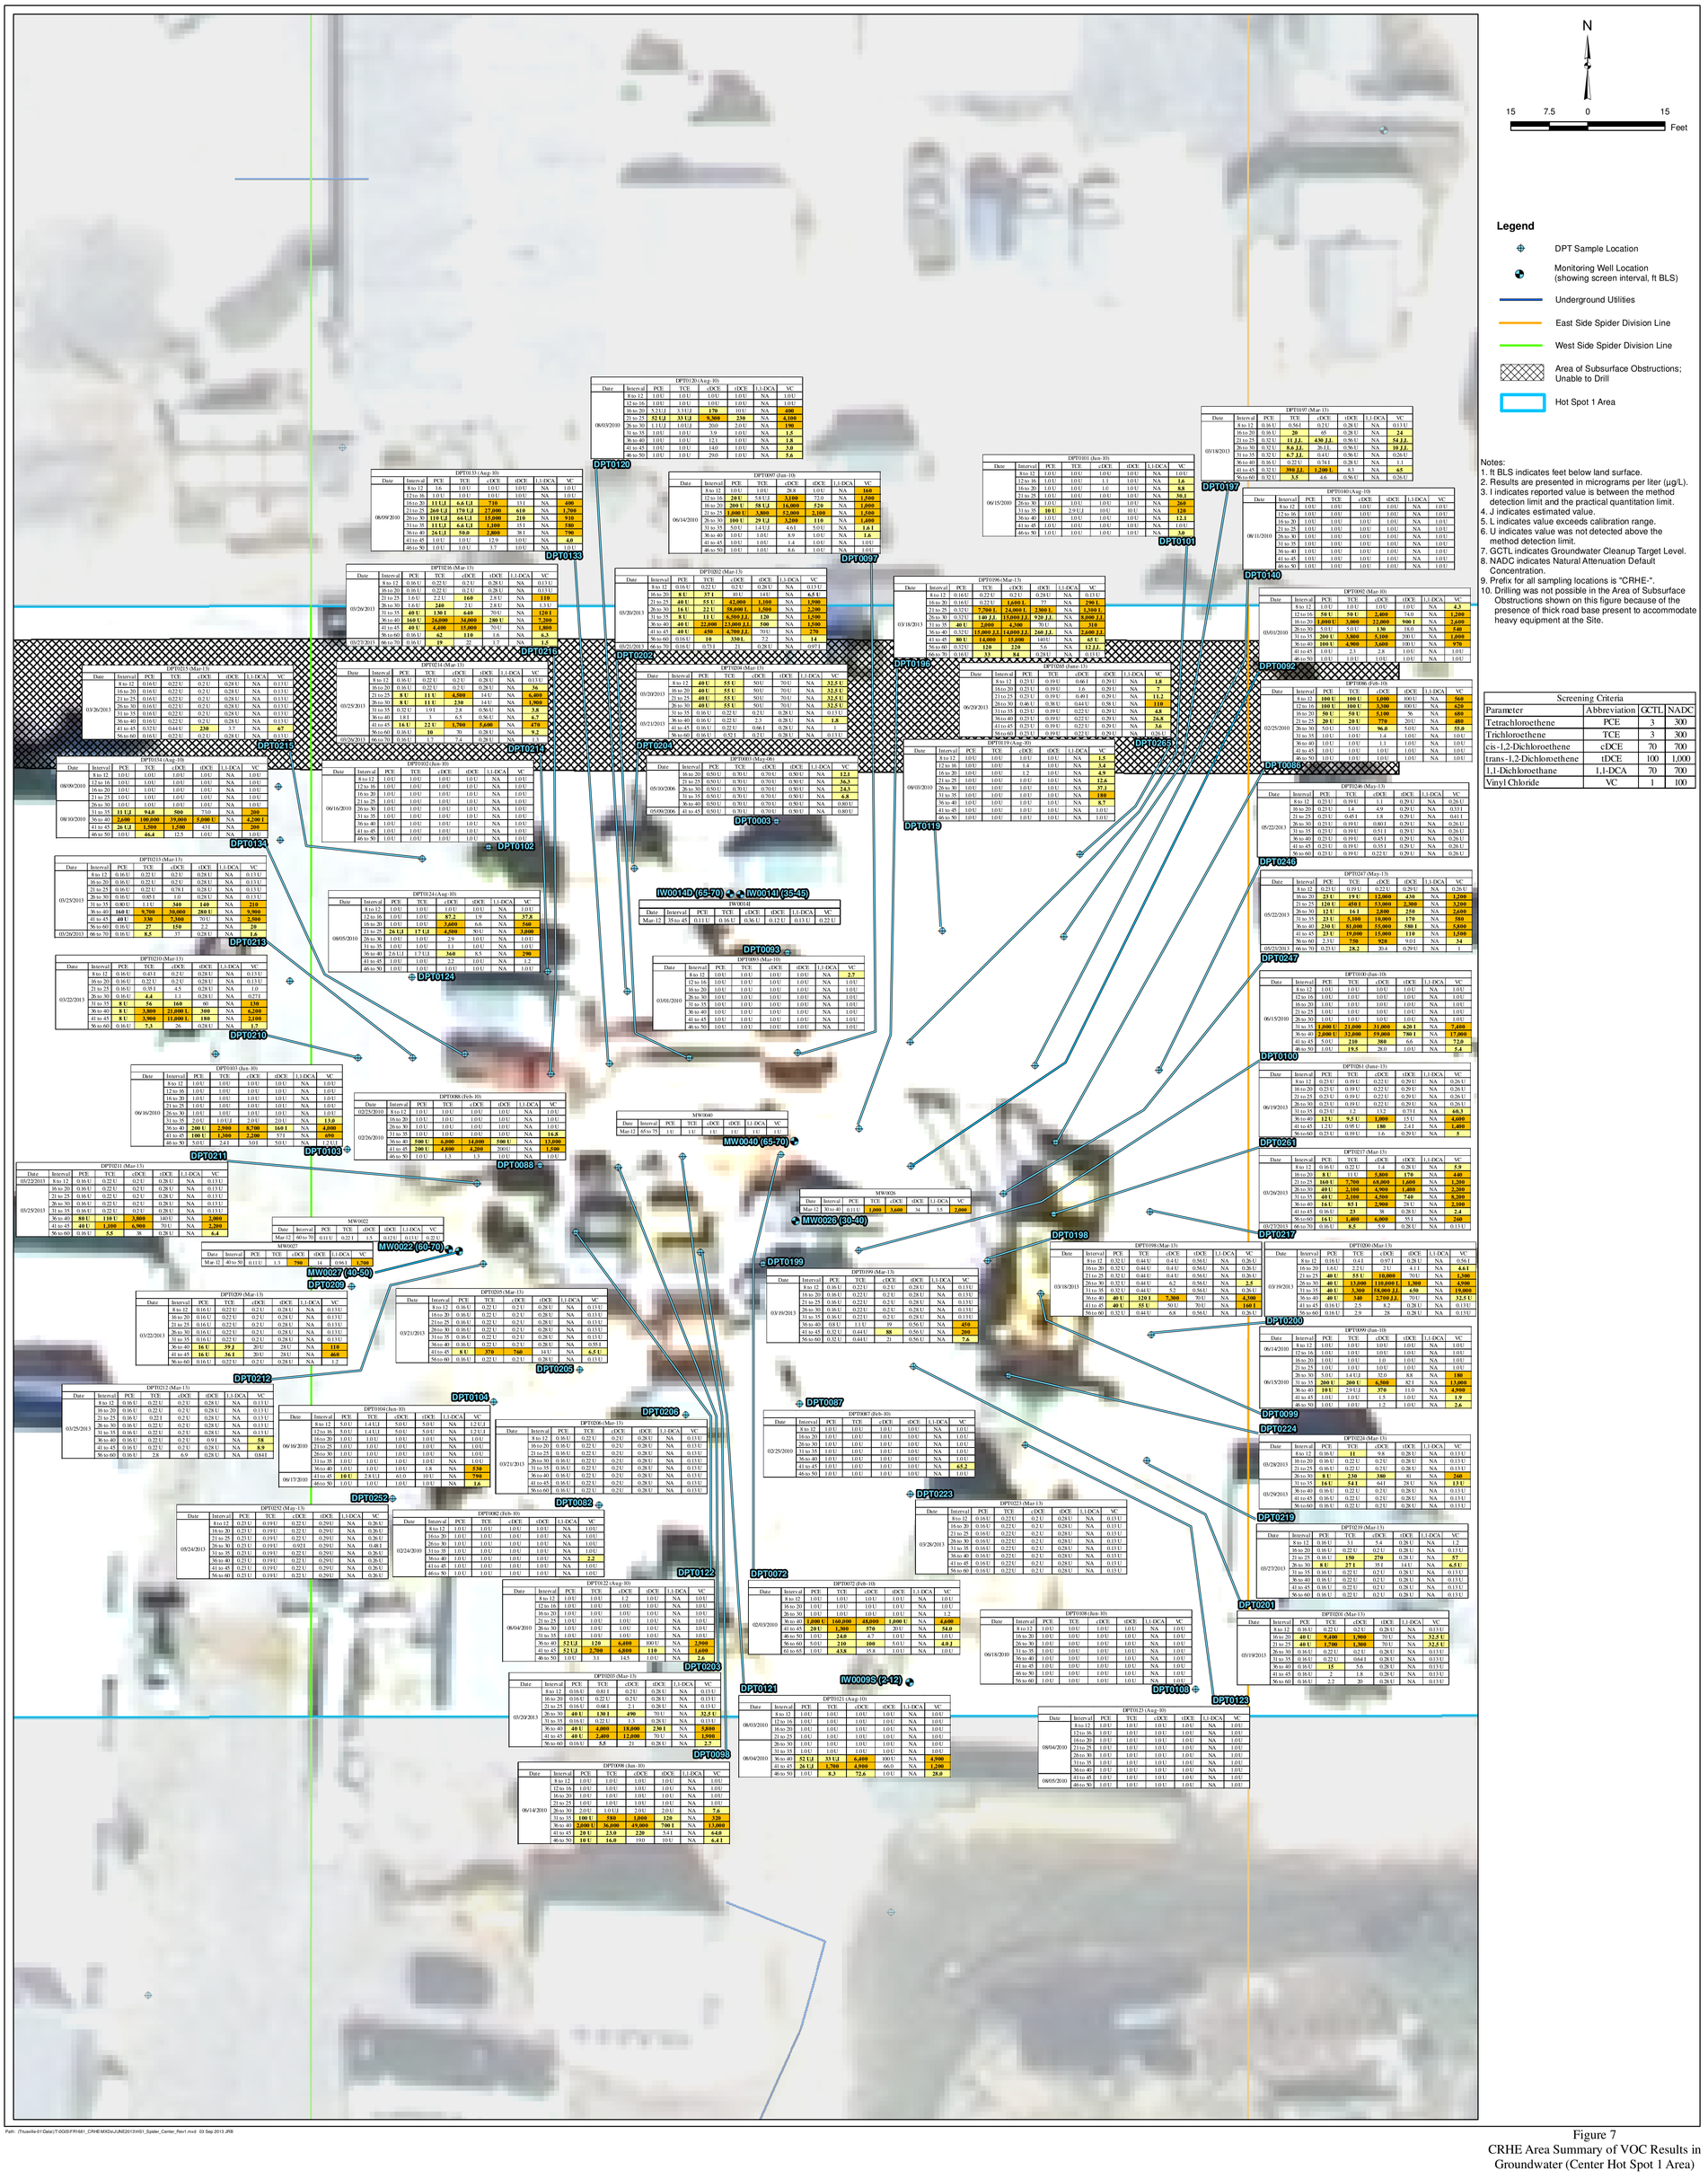
Figure 6
CRHE Area Summary of VOC Results in Groundwater (West Hot Spot 1 Area)



N
15 7.5 0 15
Feet
Legend
DPT Sample Location
Monitoring Well Location (showing screen interval, ft BLS)
Underground Utilities
East Side Spider Division Line
West Side Spider Division Line
Area of Subsurface Obstructions; Unable to Drill
Hot Spot 1 Area
Notes:
1. ft BLS indicates feet below land surface.
2. Results are presented in micrograms per liter (µg/L).
3. I indicates reported value is between the method detection limit and the practical quantitation limit.
4. J indicates estimated value.
5. L indicates value exceeds calibration range.
6. U indicates value was not detected above the method detection limit.
7. GCTL indicates Groundwater Cleanup Target Level.
8. NADC indicates Natural Attenuation Default Concentration.
9. Prefix for all sampling locations is "CRHE-".
10. Drilling was not possible in the Area of Subsurface Obstructions shown on this figure because of the presence of thick road base present to accommodate heavy equipment at the Site.

Notes:
1. ft BLS indicates feet below land surface.
2. Results are presented in micrograms per liter (µg/L).
3. I indicates reported value is between the method detection limit and the practical quantitation limit.
4. J indicates estimated value.
5. L indicates value exceeds calibration range.
6. U indicates value was not detected above the method detection limit.
7. GCTL indicates Groundwater Cleanup Target Level.
8. NADC indicates Natural Attenuation Default Concentration.
9. Prefix for all sampling locations is "CRHE-".

Figure 8
CRHE Area Summary of VOC Results in Groundwater (East Hot Spot 1 Area)

N

50 25 0 50
Feet

**Legend**

- DPT Location Not Sampled in this Interval

**DPT Sampling Location showing (highest TCE Concentration)**

- TCE concentration less than or equal to 3 µg/L
- TCE concentration greater than 3 µg/L (GCTL)
- TCE concentration greater than 300 µg/L (NADC)

**Monitoring Well Location showing (screen interval (ft BLS) and [TCE Concentration])**

- TCE concentration less than or equal to 3 µg/L
- TCE concentration greater than 3 µg/L (GCTL)
- TCE concentration greater than 300 µg/L (NADC)
- 3 µg/L TCE Isopleth based on elevated U values
- 3 µg/L TCE Isopleth
- Wetlands
- Area of Subsurface Obstructions; Unable to Drill
- Utility Corridor; Unable to Drill
- Hot Spot 1 Area
- Cleared Paths
- Underground Utility

Notes:
1. ft BLS indicates feet below land surface.
2. Results are presented in micrograms per liter (µg/L).
3. TCE indicates trichloroethene.
4. I indicates reported value is between the method detection limit and the practical quantitation limit.
5. U indicates value was not detected above the method detection limit.
6. GCTL indicates Groundwater Cleanup Target Level.
7. NADC indicates Natural Attenuation Default Concentration.
8. Prefix for all sampling locations is "CRHE-".
9. Only monitoring wells that were sampled in March 2012 are shown on this map.
10. If result was qualified with a "U", half of the detection limit was used to generate isopleths.
11. Drilling was not possible in the Area of Subsurface Obstructions shown on this figure because of the presence of thick road base present to accommodate heavy equipment at the Site.

Notes:
1. ft BLS indicates feet below land surface.
2. Results are presented in micrograms per liter (µg/L).
3. cDCE indicates cis-1,2-dichloroethene.
4. I indicates reported value is between the method detection limit and the practical quantitation limit.
5. J indicates estimated value.
6. L indicates value exceeds calibration range.
7. U indicates value was not detected above the method detection limit.
8. * indicates value was not used for contouring.
9. GCTL indicates Groundwater Cleanup Target Level.
10. NADC indicates Natural Attenuation Default Concentration.
11. Prefix for all sampling locations is "CRHE-".
12. Only monitoring wells that were sampled in March 2012 are shown on this map.
13. If result was qualified with a "U", half of the detection limit was used to generate isopleths.
14. Drilling was not possible in the Area of Subsurface Obstructions shown on this figure because of the presence of thick road base present to accommodate heavy equipment at the Site.

Figure 16
CRHE Area Summary of cDCE Results in Groundwater 31 to 46 ft BLS

N

Notes:
1. ft BLS indicates feet below land surface.
2. Results are presented in micrograms per liter (µg/L).
3. VC indicates vinyl chloride.
4. I indicates reported value is between the method detection limit and the practical quantitation limit.
5. U indicates value was not detected above the method detection limit.
6. * indicates data for DPT0193 was used for this location.
7. GCTL indicates Groundwater Cleanup Target Level.
8. NADC indicates Natural Attenuation Default Concentration.
9. Prefix for all sampling locations is "CRHE-".
10. Data presented is from the bottom depth interval for each location.
11. If result was qualified with a "U", half of the detection limit was used to generate isopleths.
12. Drilling was not possible in the Area of Subsurface Obstructions shown on this figure because of the presence of thick road base present to accommodate heavy equipment at the Site.

# MEMORANDUM

| | |
|---|---|
| Date: | 3 December 2013 |
| To: | Anne Chrest |
| Copies to: | NASA Remediation Team |
| From: | Jill Johnson, P.G. and Rebecca Daprato, Ph.D., P.E. |
| Subject: | Contractor's Road Heavy Equipment Area (CHRE) (SWMU055) Step 1 Engineering Evaluation – Hot Spot 1 – Response to Comments |

---

Comments on the October 2013 Step 1 Engineering Evaluation – Hot Spot 1 ADP have been reviewed and responses, where applicable, have been provided for reference below. The comment is listed first and Geosyntec's responses are listed in italics below the comment.

**Tetra Tech Comments:**

Tetra Tech generally concurs with the information presented in the Contractor's Road Heavy Equipment (CRHE) Area Step 1 Engineering Evaluation – Hot Spot 1 ADP, except where noted within the following comments:

Section A

1. Slide 16 – The water level MW0024 does not appear to be consistent with the expected potentiometric surface nor do the plumes appear to mimic the easterly directional divide. Is there a suspected cause for the groundwater divide in the region of this well to result in the significant easterly component? Please confirm if this is an anomaly and if MW0025 may be hydraulically communicating with MW0024.

   *Response: Historically we have observed the shallow groundwater to be influenced by the wetlands that are to the north, east, and west of the site. Therefore, the easterly groundwater flow in the shallow zone is not unexpected.*

   *Based on the lithology, it is possible that there is a hydraulic connection between monitoring wells MW0025 and MW0024. Monitoring well MW0024 is partially screened in the same unit as monitoring well MW0025 (fine grained sand with shell unit).*

*During evaluation of this comment, it was discovered that some of the groundwater elevations referenced NGVD29 and some NAVD88. The groundwater elevations have been updated to all reference NAVD88 and updated groundwater elevation maps are included.*

2. Slide 22 – TCE mass consistently seems concentrated from 36 to 45 feet bls. Are there any lithologic or geotechnical variations in this zone that resulted in the majority of mass in this depth interval? Discussion of the site conceptual model from a mass and lithologic standpoint would be a beneficial addition to the CHRE Step 1 EE and downstream remedial decision making.

   *Response: The conceptual site model will be discussed from this perspective during the ADP presentation. The lithology borings and MIP log correlate and show a change in lithology at approximately 50 ft BLS. The FID, ECD, and PID results from the MIP log and the DPT sampling results show a majority of the mass is present from 36 to 45 ft BLS. Reviewing the soil boring logs shows that between 30 and 40 ft BLS at the site, the lithology transitions from a sand with ~30% shell to sand with ~50% or more shell. Similar to other sites, the primary high concentration interval maybe associated with an interval of silty sand that is not visible to the eye.*

3. Slide 27 – Elevated TCE results are present in DPT0196, 0202, 0225, and 0247 within the 41 to 45 feet bls sampling interval, and these locations were not sampled within the 46 to 50 feet bls interval. Please confirm if this is a vertical data gap since a sampling point is not present between 45 to 56 feet bls with moderate detections from 56 to 60 feet bls.

   *Response: We do not feel that this is a data gap. There is a high density of data in each depth zone in HS1, although, as identified, toward the end of the sampling effort, sampling intervals were focused based on the previous results. Also, sampling at depth in these locations was discontinued because of the concern for dragdown and with the understanding that a vertical delineation well would be installed and sampled (MW40).*

4. Slide 41 (EVS) – When viewing the plume intervals, it is difficult to interpret the internal zones (e.g., Hot Spot and Source Zone) due to the large thickness of the data points. Suggest minimizing or showing as a discrete point within the middle of the sample interval. Review of the Source Zone in EVS was not completed due to this interference. Additionally, the deep interval bottom does not appear to be vertically delineated via EVS visual inspection.

*Response: The EVS models were revised several times with this concern in mind. The EVS model was provided for each constituent of concern with the focus on the hot spot area 1 area only, and then with the entire site shown. The locations with the concentrations less than the GCTL were made transparent in order to make the area with high concentrations easier to view. We do not feel it is necessary to revise the EVS model. Additionally, the source zone was delineated with a permanent deep well (MW40) near the highest observed TCE concentrations at the site.*

5. Slide 43/44 – Tetra Tech does not agree with the methodology used for the mass calculation and the interpretation of the site conceptual model. The mass is also not in agreement to the previous Step 1A EE presented for the site. Applying an average concentration over the entirety of the plume area and not within specific isoconcentration intervals does not seem appropriate. The averaging methods used appear to have resulted in a misrepresentation of an average concentration and mass that is skewed low. Based on the information provided within the Step 1 EE, we would anticipate the TCE mass to be higher. Please revisit the mass calculation and revise the Part B technology screening as a result of the revision, where appropriate.

   *Response: The mass calculation was performed using two different methods, both of which used the average concentrations for the specific isoconcentrations e.g., NADC >COC>GCTL, 10XNADC>COC>NADC. One was performed by depth interval and one for the overall plume (as concentric rings not averaged over the entirety of the plume). The average concentrations presented were calculated by hand and by EVS. The mass calculations consistently documented a similar mass estimate within the same order of magnitude. We believe the multiple approaches used and similarity in results provides a reasonable estimate of mass. No revisions are warranted.*

6. Slide 47 – The VC Hot Spots generally do not appear adequately delineated. Please discuss in additional detail.

   *Response: This comment has been resolved and retracted because the focus of this ADP is limited to HS1.*

7. General Comment – Was 1,4-dioxane sampled at CRHE? If so, please include in ADP.

   *Response: Select site monitoring wells were sampled and analyzed for 1,4-dioxane in 1997. The sample results were all non-detect (500 U and 2,500 U µg/L), but with detection limits greater than the FDEP GCTL (3.2 µg/L). It is proposed that samples collected from the wells that will be sampled to collect additional data to evaluate*

*bioremediation (MW0025, MW0029, MW0035 and MW0019I) will be analyzed for 1,4-dioxane.*

Section B

1. Slide 58 – Given the suspected under allocation of mass at CRHE, we do not concur to the Source Zone remedial technologies retained until the contaminant mass calculation and distribution is revised and redistributed to the team.

   *Response: See response above, additional information was provided regarding the mass calculations. We believe that the information presented is certainly adequate to make a decision regarding retained remedial technologies.*

**Jacobs-CORE**

The Step 2 Engineering Evaluation advance data package (ADP) for the Contractors Road Heavy Equipment Area (CRHE) Hot Spot 1 (HS1) meets the requirements of the Remediation Team's Engineering Evaluation Process document. Based on review of the ADP, the Jacobs-CORE team concurs with the information and evaluation presented in the CRHE Step 1 (A and B) Engineering Evaluation ADP. The following specific comments were presented for consideration:

Section A

1. Slides 13 and 14 – There are three soil borings used to generally describe the lithology across the southern portion of the plume (which includes HS1). Only one of these soil borings is within HS1, and it is primarily down gradient (west) of the highest levels of TCE. Consider adding at least one soil boring east of SB0006 and DPT0072 to ensure the entire area where DNAPL could be present is adequately characterized from a lithology perspective. It would be advantageous to understand in more specific detail the interval between 35 and 50 ft, particularly in evaluating source area treatment technologies.

   *Response: Although it is true that only one soil boring is within the HS1 area, there were a total of seven lithology borings advanced across the entire site to characterize subsurface lithology. The lithology collected at the site to date and presented in the HS1 ADP was generally consisted and is adequate for meeting the objectives of the Step 1 EE; however, we agree that potentially collecting additional, focused lithology data in the selected remedial area depending on the selected remedy may be useful. This additional data can be gathered before the remedy is implemented.*

2. Slides 13, 14, 24, and 42 – The lithology description shows a fairly consistent fine-grained sand and shell layer from approximately 12 to 50 ft bls; however, the highest levels of TCE are shown in the 36 to 40 ft bls depth range. This indicates something pertinent in or just below this zone, which could be holding DNAPL, and that is discussed on Slide 42. Should that be shown on the lithology drawing (Slide 14)? Again, more detail of this interval would be beneficial in planning and executing any technology which targets the source zone.

   *Response: The lithology presented on the cross section (Figure 1) is generalized and the surfaces for lithology transitions were correlated. See response to Tetra Tech comment #2. In SB0006, there are changes in the ratios of sand, shell and clay at 35, 41, and 51 ft BLS. As discussed in a previous response, depending on the selected remedial options, it may be useful to collect additional, focused lithology information in this zone.*

3. Slide 17 – The shape of the plume generally provides good confirmation of the gradient and gradient trends at a site. The CRHE intermediate groundwater flow map shows a fairly strong southerly component that does not correlate well with the plume configuration. Could the MW0029 measurement be incorrect (possibly a damaged well)?

   *Response: It does appear that monitoring well MW0029 is controlling the groundwater flow direction, but we feel this is based on the limited number of water levels that were collected, since this effort was focused on Hot Spot 1. There was no damage observed to the well during the water level collection.*

4. Slides 26 and 44 to 46 – Minor comment, but from a remediation perspective it seems prudent to assume that the area between DPT0098 and DPT0216 is above 1% solubility (contoured purple). The same could be considered for the area between DPT0247 and DPT0196, along with the area between DPT0134 and DPT0225. Again, this is just from a remediation perspective based upon the potential error in sampling in these high concentration areas, but it affects the SZ area shown on Slides 44 – 46, and also would affect the size and planning of any SZ remediation alternative.

   *Response: We concur that the 1% solubility areas could be combined into one area for the purposes of the Step 2 and Step 3 EE.*

5. Slides 43 and 44 – Both slides note that DNAPL mass was not considered in estimating contaminant mass. What is the rationale for excluding DNAPL from the mass estimate? Consider developing mass estimates for the SZ and HS independently (including DNAPL mass), then adding those to the gross average of the remaining HCP and LCP.

*Response: The note on the slide was intended to indicate that a specific quantity of DNAPL product at a 12.2 lb/gallon density was not considered to occupy some assumed fraction of pore spaces over some assumed area and assumed thickness (consistent with other mass estimates conducted at KSC). We considered the sorbed mass partitioned fraction to account for DNAPL (ganglia and/or limited sorbed form present). Estimating the DNAPL mass at a site is difficult, even with high resolution soil and groundwater sampling data (no soil sampling has been performed at this site). If it is assumed that the DNAPL occupies 0.01 to 0.1% of pore space (of 1% solubility area), there would be approximately 0.45 to 4.5 gallons of TCE DNAPL, which is approximately 5.5 to 55 lbs of DNAPL. Regardless of the absence/presence and/or form the DNAPL is in at the Site, the overall mass estimate provides a reasonable order of magnitude estimate of mass likely present at the Site.*

Section B

1. Slide 53 (SZ Technology Screening) – Regarding elimination of LDA as an alternative. True that the SZ area is small which could make it cost prohibitive for LDA, but this area is totally accessible and, considering the performance of LDA projects locally that have shown >95% efficiency over time, it may be worth considering since the likelihood of enhanced effectiveness could out-weigh the negative aspect of a higher cost. At a minimum, it would be nice to understand the costs associated with LDA compared to other technologies, especially considering the performance.

   *Response: We do not feel that LDA is an appropriate technology for this site based on the following: (i) the technology is better suited for source zones with significant DNAPL mass and mass stored in low permeability zones; (ii) access at the site is difficult due to buildings and storage of large pieces of equipment and conex boxes; and (iii) settling at the site after LDA implementation could result in damage to buildings or loss of storage area for the facility.*

2. Slide 53 (SZ Technology Screening) – Air Sparge Retained: It is evident that there is a low permeable zone somewhere around 40 ft bls which is possibly holding DNAPL. Will Air Sparging be able to effectively permeate through this zone and access the source mass that may be dispersed in diffusion limited zones? This has historically been an issue with sites that rebound following the use of pump and treat and air sparge technologies. If you have already compared the CRHE lithology to other sites where Air Sparging is effective and found that the CRHE lithology is favorable, a statement to that effect would be helpful. If not, the additional lithologic boring suggested above would be helpful, or consider whether a pilot test is needed.

*<u>Response</u>: The lithology borings collected at CRHE did not indicate any low permeability zone above approximately 50 ft BLS. We do believe that air sparging will effectively treat the mass at this site, if the system is installed and operated properly. Additional soil borings can be collected as part of the Step 3 EE to assure the sparge screens are set in the appropriate locations.*

3. Slide 58 – Air Sparge and Bioremediation are listed as scalable to larger treatment areas. Please confirm that other combined technologies, such as EZVI and Bioremediation, will also be looked at for scaling to larger zones.

*<u>Response</u>: EZVI was only going to be evaluated in the area with TCE concentrations greater than 1% solubility EZVI will not be considered for scaling to larger zones due to the elevated cost which would be anticipated in a larger area.*

* * * * * *

# STEP 2 FOR HS1
# ENGINEERING EVALUATION ADP
# (electronic copy only)

Geosyntec consultants

# Contractor's Road Heavy Equipment (CRHE) Area (SWMU055)

## Step 2 Engineering Evaluation – Hot Spot 1

February 2014

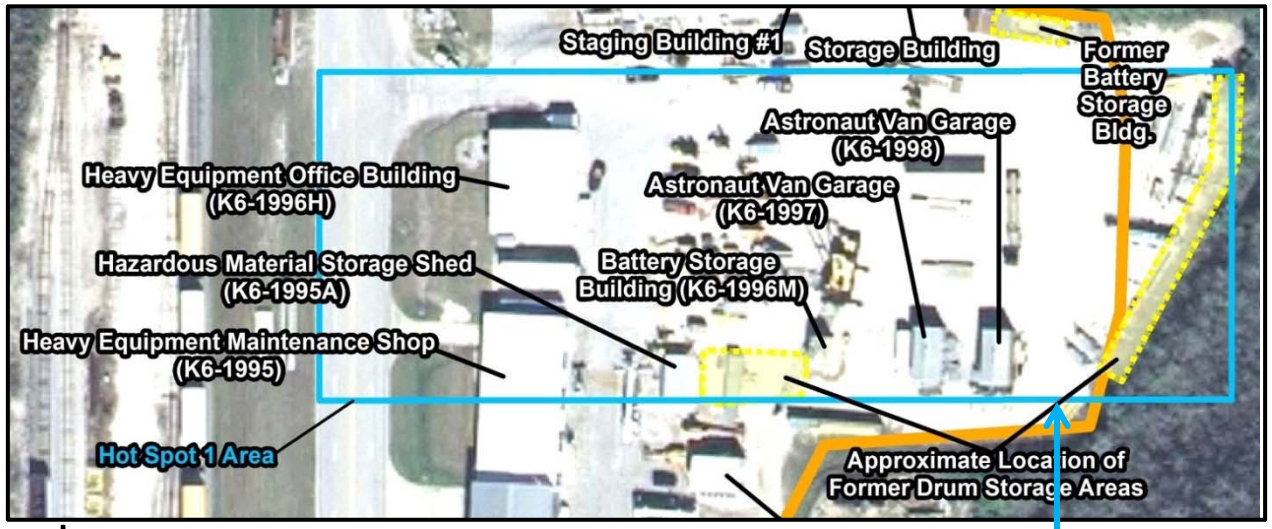
# Presentation Outline

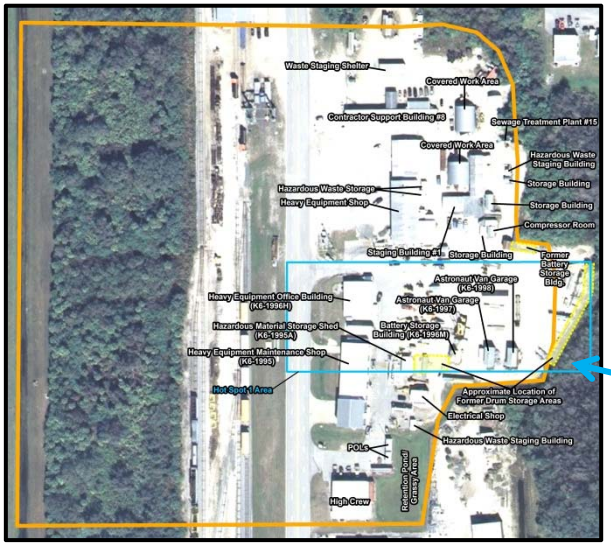
- Site history and background
- Summary of Step 1 Engineering Evaluation (EE)
- Data gaps
- Technology evaluations
- Recommendations and proposed path forward

# Site History and Background
## Site Location

# Site History and Background
## Site Overview

- HS1 features:
  - About 3 acres
  - Paved and gravel
  - Underground utility corridor east of Contractor's Road
  - Thick road base in northern part of HS1
  - Overall 10xNADC Plume runs beneath K6-1996H and Contractor's Road
  - Heavy equipment (up to 300,000 lbs) transported and stored in the area



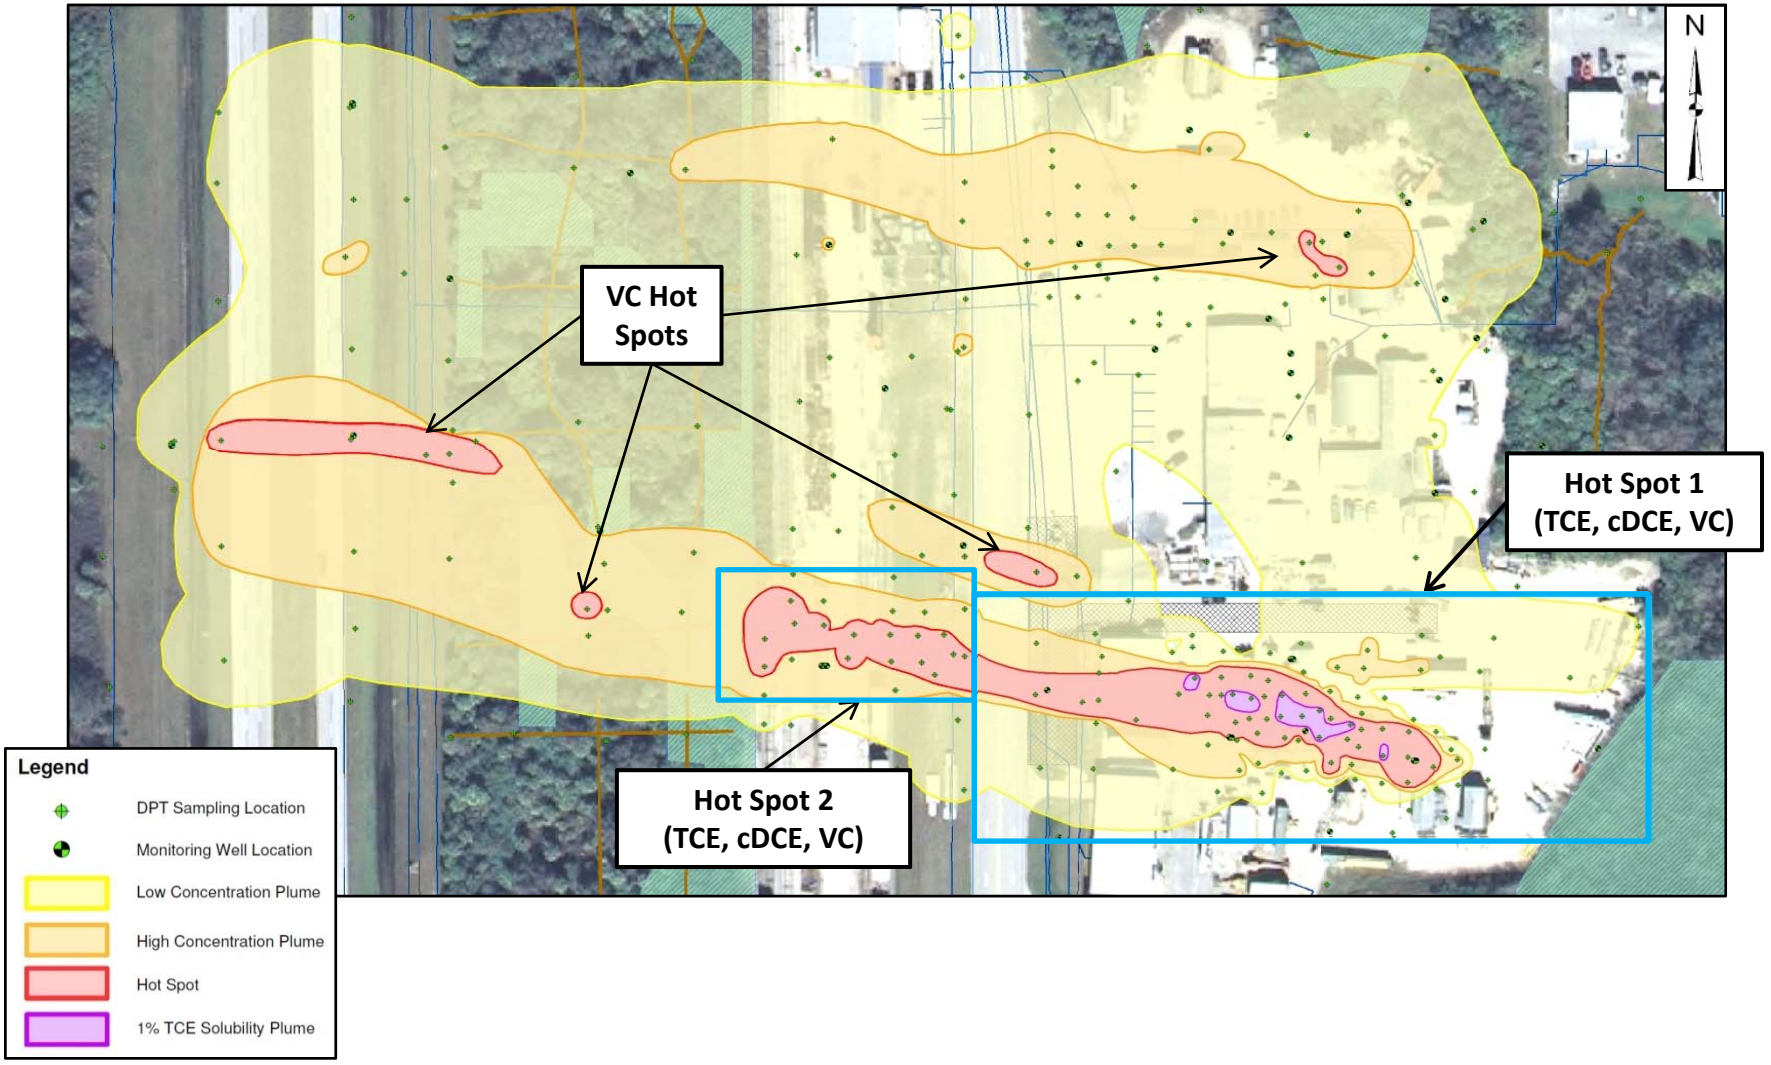


Hot Spot 1 Area

# Site History and Background

- 1994: Preliminary assessment (EG&G, Inc.)
- 1997-1999: RFI (HSW, Inc.)
- 2000: Corrective Measures Study (CMS) (HSW, Inc.)
- 2000 – 2005: Semi-annual groundwater sampling in 7 wells
- 2005 – 2009: Site incorporated into VAB LTM program
- 2010 May: Discontinued LTM until assessment is complete
- 2009 – 2013: Supplemental site assessment
- 2012 June: Site-wide Step 1 EE
  - Additional sampling recommended and is on-going
- 2013 December: Hot Spot 1 Step 1 EE
  - Source Zone (TCE greater than 11,000 µg/L – 1% solubility): recommended evaluation of bioremediation, emulsified zero valent iron (EZVI), and air sparge/soil vapor extraction (AS/SVE)
  - Overall CVOC 10xNADC Plume: recommended evaluation of Bio, EZVI with Bio, and AS/SVE

# Site History and Background
## Overall Site and Identification of Hot Spots



# Goals of Presentation

- Goals of Presentation
  - Present Step 2 Engineering Evaluation
  - Obtain team consensus on treatment area (Overall 10xNADC or Source Zone) and technology for Interim Measures (IM)

# Hot Spot 1 Step 1 EE Summary
# Lithology Cross Section

Approximate location of western portion of HS1

A

A'

SB0005

SB0007

SB0006

Elevation

Medium sand (SP) and silty sand (SM)

Fine to medium sand (SP/SW) with shell hash

Fine-grained sand (SP) with 30 to 50% shell

Silty sand (SM) with clay and up to 10% shells

Fine silty sand (SM) with 20 to 30% shell fragments

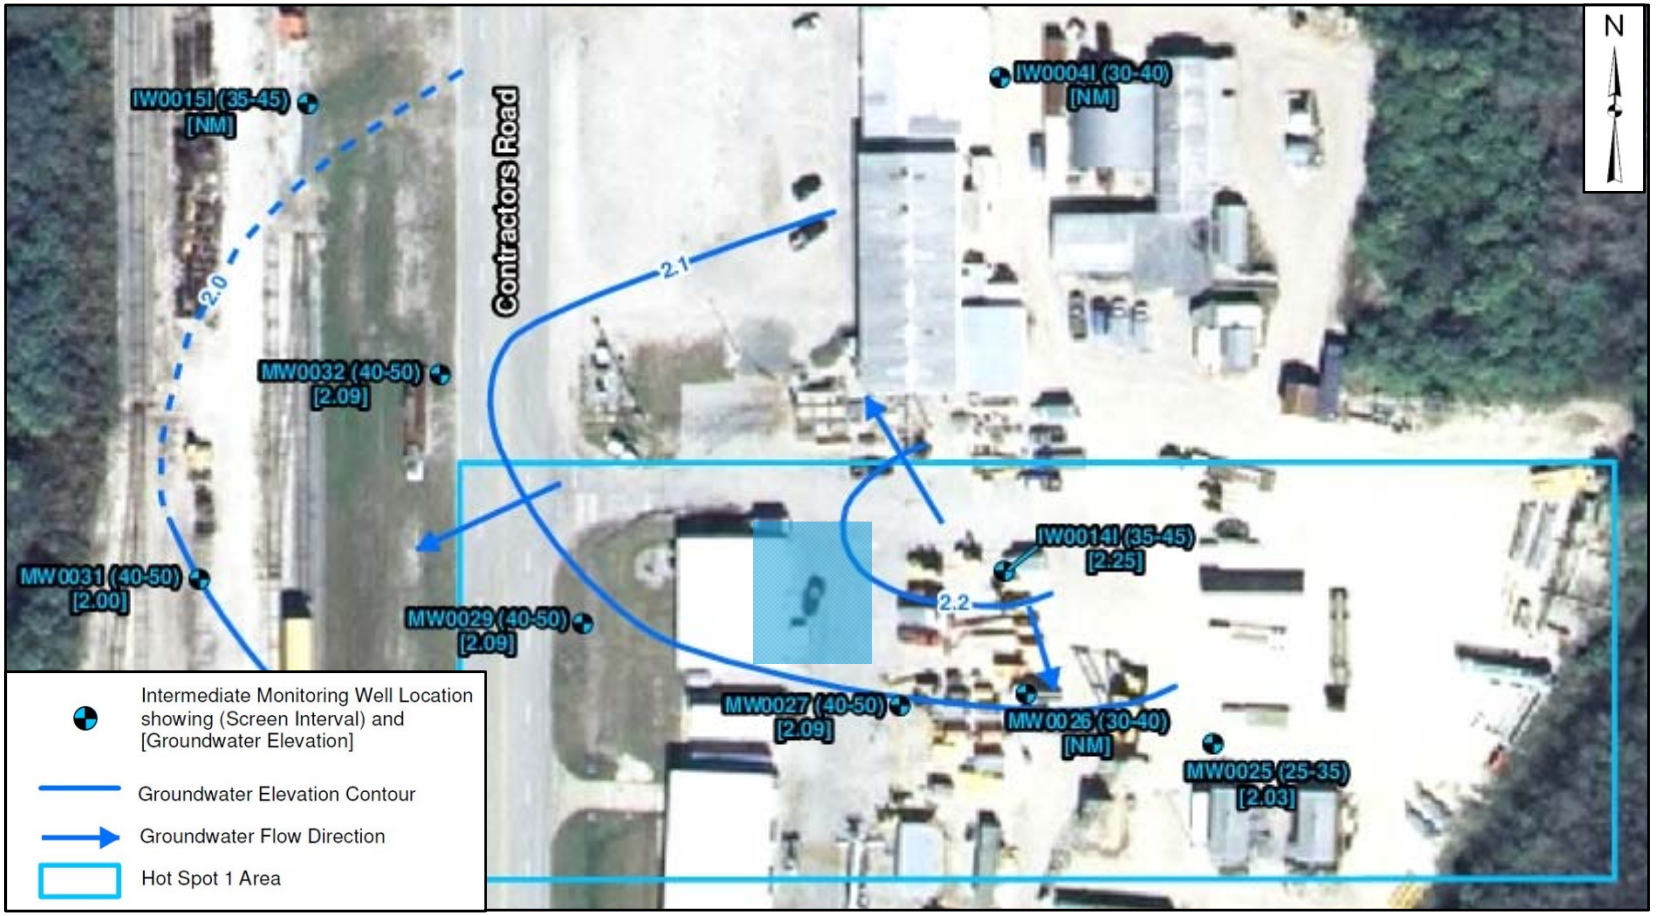
# Hot Spot 1 Step 1 EE Summary
# Groundwater Flow and Hydraulic Conductivity

- Groundwater flow in the intermediate zone is generally to the west
- Depth to groundwater ranges from 2 to 6 ft BLS
- Hydraulic conductivity (K) is 7.6 ft/d (2,774 ft/yr) - from specific capacity tests on shallow and intermediate wells during RFI

| GW Zone | Approximate Depth (ft BLS) | Average Gradient (ft/ft) | Estimated GW Flow Velocity (ft/y) |
|---|---|---|---|
| Shallow | <15 | 0.002 | 28 ft/y* |
| Intermediate | 15 to 55 | 0.005 | 69 ft/y* |
| Deep | >60 | 0.002 | -- |

* Actual groundwater flow velocity is likely highly variable with higher K plume transport intervals and lower K mass storage intervals.

# Hot Spot 1 Step 1 EE Summary
# Groundwater Flow and Hydraulic Conductivity



Note:

1. Screen interval is presented in feet below land surface (ft BLS).
2. Elevation is presented in ft and is referenced to the North American Datum of 1988.

# Hot Spot 1 Step 1 EE Summary Delineation Summary

- Impacts generally from 8 to 50 ft BLS
- Max concentrations (µg/L)
  - TCE = 160,000 (DPT72, 36 to 40 ft BLS)
  - cDCE = 110,000 L (DPT200, 26 to 30 ft BLS)
    - L indicates the value exceeded the calibration range
  - VC = 19,000 (DPT200, 31 to 35 ft BLS)
- SZ contaminant mass is mainly 30 to 46 ft BLS (60% of mass in that zone within 36 to 40 ft BLS)
- Lithology
  - primarily sand until ~45 to 50 ft BLS (based on visual observations, MIP data, and DPT data)
  - below ~45 to 50 ft BLS, lithology is silty sand, with varying amounts of clay (semi-confining layer)
- Summary maps presented in ADP – Step 1 EE attached as reference which includes all CVOC interval maps

# Hot Spot 1 Step 1 EE Summary
# TCE Plume

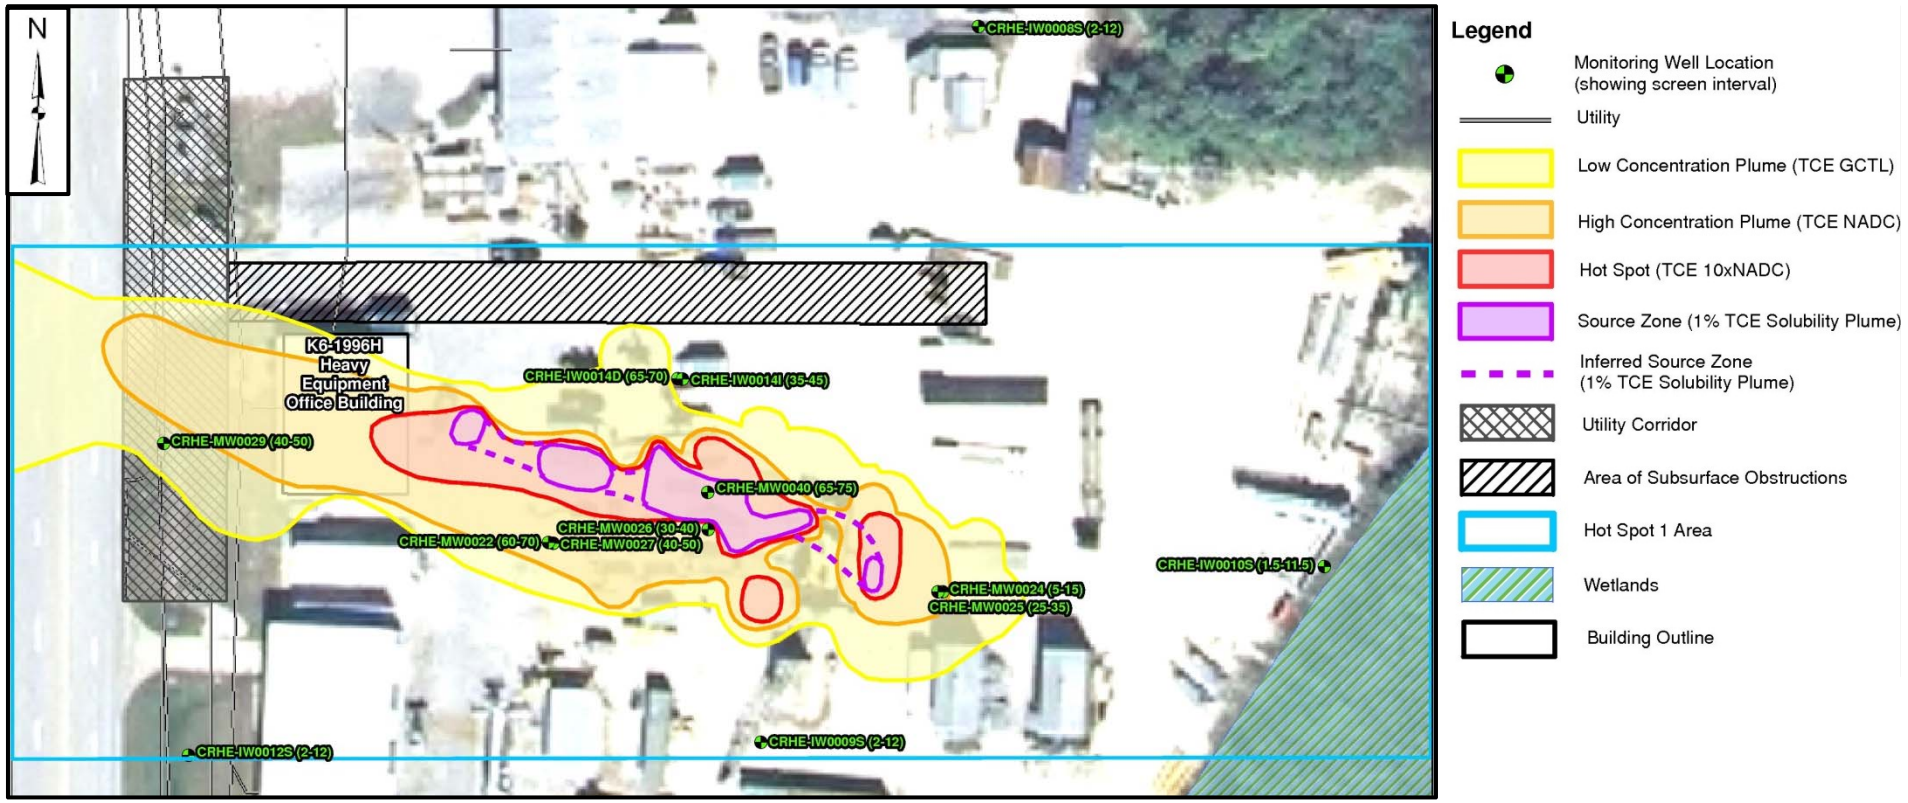


Figure 1

- The Source Zone (SZ) is defined as the area with TCE greater than 1% solubility (11,000 µg/L)
- Inferred SZ contour creates a single, more conservative SZ evaluated for treatment in consideration of likely subsurface distribution

# Hot Spot 1 Step 1 EE Summary
# 10xNADC Plumes

# Hot Spot 1 Step 1 EE Summary Mass Calculations

| | Average Concentration (µg/L) | Source of Average Concentration | Area ($ft^2$) | Thickness (ft) | Pore Volume (L) | Dissolved Mass (lbs) | Equilibrium Soil Concentration (mg/kg) | Sorbed Mass (lbs) | Total Mass (lbs) |
|---|---|---|---|---|---|---|---|---|---|
| 300 µg/L > TCE > 3 µg/L | 52 | Hand Calculated | 34,412 | 25 | 6.09E+06 | 0.7 | 0.02 | 2.1 | 2.8 |
| | 27 | EVS Estimate | --- | --- | 4.17E+06 | 0.2 | 0.01 | 0.8 | 1.0 |
| 3,000 µg/L > TCE > 300 µg/L | 1,314 | Hand Calculated | 17,860 | 10 | 1.26E+06 | 3.7 | 0.63 | 11.3 | 15 |
| | 995 | EVS Estimate | --- | --- | 3.12E+05 | 0.7 | 0.48 | 2.1 | 2.8 |
| 11,000 µg/L > TCE > 3,000 µg/L | 5,947 | Hand Calculated | 5,663 | 10 | 4.01E+05 | 5.3 | 2.9 | 16.2 | 21 |
| | 5,047 | EVS Estimate | --- | --- | 5.01E+04 | 0.6 | 2.4 | 1.7 | 2.3 |
| TCE > 11,000 µg/L | 46,750 | Hand Calculated | 1,742 | 5 | 6.17E+04 | 6.4 | 22 | 19.5 | 26 |
| | 19,701 | EVS Estimate | --- | --- | 4.45E+03 | 0.2 | 9.5 | 0.6 | 0.8 |
| | | | | | Total Dissolved Mass | 1.7 to 16 lbs | Total Sorbed Mass | 5.2 to 49 lbs | |
| | | | | | | | Total TCE Mass | 6.9 to 65 lbs | |
| 700 µg/L > cDCE > 70 µg/L | 236 | Hand Calculated | 31,799 | 25 | 5.63E+06 | 2.9 | 0.03 | 2.5 | 5.4 |
| | 246 | EVS Estimate | --- | --- | 1.24E+06 | 0.7 | 0.03 | 0.6 | 1.2 |
| 7,000 µg/L > cDCE > 700 µg/L | 3,153 | Hand Calculated | 24,829 | 20 | 3.52E+06 | 24 | 0.4 | 21 | 45 |
| | 2,184 | EVS Estimate | --- | --- | 5.81E+05 | 2.8 | 0.3 | 2.4 | 5.2 |
| cDCE > 7,000 µg/L | 26,443 | Hand Calculated | 10,019 | 10 | 7.09E+05 | 41 | 3.5 | 35 | 76 |
| | 14,386 | EVS Estimate | --- | --- | 1.36E+05 | 4.3 | 1.9 | 3.7 | 8.0 |
| | | | | | Total Dissolved Mass | 7.8 to 69 lbs | Total Sorbed Mass | 6.6 to 58 lbs | |
| | | | | | | | Total cDCE Mass | 14 to 127 lbs | |
| 100 µg/L > VC > 1 µg/L | 18 | Hand Calculated | 86,249 | 30 | 1.83E+07 | 0.7 | 0.001 | 0.3 | 1.1 |
| | 10 | EVS Estimate | --- | --- | 1.18E+07 | 0.2 | 0.001 | 0.1 | 0.4 |
| 1,000 µg/L> VC > 100 µg/L | 387 | Hand Calculated | 33,977 | 20 | 4.81E+06 | 4.1 | 0.03 | 2.0 | 6.1 |
| | 321 | EVS Estimate | --- | --- | 1.13E+06 | 0.8 | 0.02 | 0.4 | 1.2 |
| VC > 1,000 µg/L | 3,672 | Hand Calculated | 18,731 | 15 | 1.99E+06 | 16 | 0.28 | 7.8 | 24 |
| | 2,375 | EVS Estimate | --- | --- | 5.99E+05 | 3.1 | 0.18 | 1.5 | 4.7 |
| | | | | | Total Dissolved Mass | 4.2 to 21 lbs | Total Sorbed Mass | 2 to 10 lbs | |
| | | | | | | | Total VC Mass | 6.2 to 31.1 lbs | |
| | | | | | | | Total Mass | 27 to 223 lbs | |

**Notes:**

1. Pore volume for EVS calculations was estimated via EVS and for the hand calculations was estimated using area and depth provided assuming a porosity of 0.25.
2. Soil density assumed to be 100 $lb/ft^3$.
3. Foc assumed to be 0.003 which was taken from estimate provided by Tetra tech in Step 1 ADP for Hot Spot 2 for a sand with shell.
4. Koc data calculated from Sawyer, McCarty and Parkin, 5th Edition (2002); TCE = 165.7 L/kg, cDCE = 45.6 L/kg and VC = 26.3 L/kg.

# Hot Spot 1 Step 1 EE Summary
# Estimated Source Zone CVOC Mass

| SZ CVOC | Average Concentration (µg/L) | GIS Area ($ft^2$) | Thickness (ft) | Volume ($ft^3$) | Pore Volume (L) | Dissolved Mass (lbs) | Equilibrium Soil Concentration (mg/kg) | Sorbed Mass (lbs) | Total Mass (lbs) |
|---|---|---|---|---|---|---|---|---|---|
| TCE | 46,750 | 3,049 | 5 | 15,246 | 1.08E+05 | 11.1 | 22.5 | 34.2 | 45.3 |
| cDCE | 26,443 | 3,049 | 5 | 15,246 | 1.08E+05 | 6.2 | 3.5 | 5.3 | 11.6 |
| VC | 3,672 | 3,049 | 5 | 15,246 | 1.08E+05 | 0.86 | 0.28 | 0.43 | 1.3 |
| | | | | | **Total Dissolved Mass :** | **18 lbs** | **Total Sorbed Mass:** | **40 lbs** | |
| | | | | | | | | **Total SZ Mass:** | **58 lbs** |

1. Porosity assumed to be 0.25.
2. Area is the Source Zone area , which includes the inferred area (total of 0.07 acres). This area is larger than what was presented in the mass calculations for the Step 1 EE ADP.
3. Soil density assumed to be 100 $lb/ft^3$ .
4. $F_{oc}$ assumed to be 0.003 which was taken from an estimate provided by Tetra Tech in Step 1 ADP for Hot Spot 2 for a sand with shell.
5. $K_{oc}$ data calculated from Sawyer, McCarty and Parking, $5^{th}$ Edition (2002): TCE = 165.7 L/kg, cDCE = 45.6 L/kg and VC = 25.3 L/kg.
6. Volume calculated from GIS area of TCE source zone impacts and inferred depth based on sampling results.
7. Average groundwater concentrations calculated from DPT groundwater sampling results.
8. Total mass is rounded to nearest whole number.

# Hot Spot 1 Step 1 EE Summary
# Estimated 10xNADC Plume CVOC Mass

| SZ CVOC | Average Concentration (µg/L) | GIS Area ($ft^2$) | Thickness (ft) | Volume ($ft^3$) | Pore Volume (L) | Dissolved Mass (lbs) | Equilibrium Soil Concentration (mg/kg) | Sorbed Mass (lbs) | Total Mass (lbs) |
|---|---|---|---|---|---|---|---|---|---|
| TCE (SZ) | 46,750 | 3,049 | 5 | 15,246 | 1.08E+05 | 11.1 | 22.5 | 34.2 | 45.3 |
| TCE (no SZ)* | 5,947 | 2,614 | 10 | 26,136 | 1.85E+05 | 2.4 | 2.9 | 7.5 | 9.9 |
| cDCE | 26,443 | 10,019 | 10 | 100,188 | 7.09E+05 | 41.3 | 3.5 | 35.0 | 76.4 |
| VC | 3,672 | 18,731 | 15 | 280,962 | 1.99E+06 | 16.1 | 0.28 | 7.8 | 24.0 |
| | | | | | **Total Dissolved Mass :** | **71 lbs** | **Total Sorbed Mass:** | **85 lbs** | |
| | | | | | | | | **Total 10xNADC Plume Mass:** | **156 lbs** |

1. Porosity assumed to be 0.25.
2. Soil density assumed to be 100 lb/$ft^3$.
3. Areas are the area of 10xNADC for each constituent and are presented on Figure 2.
4. $F_{oc}$ assumed to be 0.003 which was taken from an estimate provided by Tetra Tech in Step 1 ADP for Hot Spot 2 for a sand with shell.
5. $K_{oc}$ data calculated from Sawyer, McCarty and Parking, 5th Edition (2002): TCE = 165.7 L/kg, cDCE = 45.6 L/kg and VC = 25.3 L/kg.
6. Volume calculated from GIS area and inferred depth based on sampling results.
7. * indicates that the TCE area is the 10X NADC area minus the SZ area (5,663 $ft^2$ – 1,742 $ft^2$).
8. Average groundwater concentrations calculated from DPT groundwater sampling results.
9. Total mass is rounded to nearest whole number.

# Response to Comments

TT Comment #2: Slide 18/19 (new slide 20/21) – The mass values deviate significantly from what was presented in the Step 1 EE. We suggest providing information to what influenced the increase in calculated mass from the Step 1 to 2 EE, the Geosyntec presentation response to Tetra Tech's Step 1 EE comment regarding mass does not parallel what is provided in the Step 2 EE.

*Response: The mass estimates from the Step 1 ADP have been added to the ADP. For the source zone, the TCE mass estimate was modified from what was presented in the Step 1 because the area increased (see note 2 of the table – increase from 1,742 sq ft to 3,049 sq ft). The mass of TCE in the source zone from the Step 1 was approximately 26 lbs (using the hand calculated values to be conservative) and the revised mass of TCE presented in the Step 2 is 45 lbs. The cDCE and VC mass estimates were not presented for the source area in the Step 1 ADP.*

*The mass estimate presented for the 10XNADC area is the same as the mass estimate that was presented in the revised Step 1 for cDCE and VC (using the hand calculated values, which are the most conservative). The TCE mass estimate for the 10XNADC area was modified because the area of the source zone increased. In the Step 1, the mass estimates were presented as "rings" and not totals for the areas, so the 10XNADC estimate did not include the source zone TCE mass.*

# Data Gaps
## Geochemical Parameters

- Geochemical parameters for Source Zone and 10xNADC Plume
  - DO generally from 0.13 to 0.40 mg/L
  - ORP generally from negative 70 to negative 29 mV
  - pH generally ranged from 6.8 to 7.3 SU
- Parameters from data gap sampling (December 2013; CRHE-MW0025 and CRHE-MW0029)
  - *Dehalococcoides:* $1x10^7$ and $2x10^7$ gene copies per liter
  - *Vinyl chloride reductase*: $3x10^6$ and $8x10^6$ gene copies per liter
  - Methane: 1,180 and 1,260 µg/L
  - Ethene: 31.5 and 672 µg/L
  - Ethane: 15.5 and 382 µg/L
  - Sulfate: non-detect and 7.8 mg/L
  - Sulfide: non-detect and 0.48 mg/L
- Strong evidence that biologically mediated reductive dechlorination is occurring at the site

# Data Gaps
## 1,4-Dioxane Results

- 1,4-dioxane is not an issue for remedial decision making
- Will include 1,4-dioxane in monitoring program

- MW25 (25 to 35 ft BLS)
  - 14.5 µg/L
  - Exceeds GCTL (3.2 µg/L)
- MW29 (40 to 50 ft BLS)
  - 1.3 I µg/L
- IW19I (35 to 45 ft BLS)
  - 1 U µg/L
- MW35 (40 to 50 ft BLS)
  - 3.9 µg/L
  - Exceeds GCTL (3.2 µg/L)

# Data Gaps
## Facility Conditions

- Transformer identified north of the Heavy Equipment Office Building
  - Requested information from URS Electrical SE – looking into transformer condition and availability of space for AS/SVE systems
- Contacted NASA's utility locators about working in utility corridor
  - Will be allowed to drill and trench
  - Must hand auger to water table before drilling
  - Trenches must be hand dug
- Contacted with NASA about working in the road way
  - Will have to develop an MOT to temporarily shut down roadway for installation of wells or DPT injection (only for 10xNADC treatment area)
- Facility manager provided information that maximum weight of equipment onsite is approximately 300,000 lbs
  - Load per axle could be as high 65,000 pounds per axle
  - Vault boxes meet DOT H-20 requirements (8,000 lb front axle and 32,000 lb rear axle)

# Data Gaps
## Supplemental Sampling

- Supplemental DPT groundwater sampling will be performed in 2014 as part of HCP and LCP delineation
  - Samples will be collected from under the Heavy Equipment Office Building and from within the roadway (Contractor's Road)
  - This data will be incorporated into the design
    - IM Design Report or the Implementation Work Plan

# Hot Spot 1 Corrective Action Objective

- CAO: Reduce CVOC concentrations within the treatment area to less than NADCs or concentrations which will support Long Term Monitoring
- Treatment areas
  - Overall 10xNADC
  - Source Zone
- NASA may elect to continue IM to GCTLs and/or some alternative asymptotic level based upon performance

# Response to Comments

Jacobs Comment #1: Slide 24 (new slide 27) – For the CAO, please clarify what is meant by "concentrations which will support Long Term Monitoring." Since the CAO applies to a hot spot and source zone, it seems an HCP action would be a potential follow-on step as overall site cleanup progresses.

*Response: With the existing CAO, NASA, the KSC Remediation Team, and the A&E have the flexibility to evaluate performance and base a recommendation for follow-up action (if necessary) on the performance. If the CAO is to progress the site to an HCP action, it does not provide the same level of flexibility and decision making based on implementation results*.

# Alternatives Evaluated

- Source Zone
  - 1A – Air sparge and soil vapor extraction (AS/SVE)
  - 2A – Bioremediation using emulsified oil (EOS)
  - 3A – Emulsified zero valent iron (EZVI)

- 10xNADC Plume
  - 1B – AS/SVE
  - 2B – Bioremediation using EOS with groundwater recirculation and passive venting beneath the building
  - 3B – EZVI in SZ and bioremediation (10X NADC) using EOS with groundwater recirculation and passive venting beneath the building

- All alternatives include institutional controls

# 1A – Air Sparge and SVE SZ

# SZ Air Sparge and SVE Conceptual Design

- Installation of 13 air sparge (AS) wells via HSA
  - Screened from ~48 to 50 ft BLS
  - Spacing between wells of approximately 20 ft with an assumed ~20 ft ROI
    - Conservative conceptual spacing with robust overlap since in area of probable DNAPL
  - 25-hp AS system operating one of two zones at a time
  - Use mobile air sparge trailer #3 (conservative 25 hp compressor)
    - Assumes electrical hookup available on site (transformer SS/USS-1103)
    - Capable of 190 scfm and 31.9 psi (estimated need ~ 30 psi to most distal well)
  - Anticipated flow rate of 5 to 10 scfm per well
- Purchase of SVE system – 11 SVE chambers installed to capture vapors in treatment area
  - 10-hp SVE system operating one of two zones at a time
  - Anticipated flow rate of 20 to 30 scfm per chamber
  - Granular activated carbon (GAC) treatment of recovered vapors
  - SVE chambers (to maximize air flow) branch off central line through SZ

Geosyntec consultants

# Response to Comments

TT Comment #5: Slide 27/32/35 (new slide 31/39/46) – Is there an assumed vacuum to be applied at the horizontal SVE points that was used for SVE sizing? We also suggest including a variable frequency drive on the blower/fan in order to dial in the blower to site conditions and/or perform SVE pilot testing, if alternatives with SVE are selected. Additionally, it is not clear in the details if the chambers shown on Slide 32 contain valve boxes/vaults in order to individually control the chambers. Please clarify.

*Response: It is anticipated that the SVE system will include a blower capable of greater than 360 scfm and operate at approximately 20-inches of water to minimize the extraction of water (likely a 15 Hp Ametek Rotron Regenerative Blower). We agree that a variable frequency drive blower should be considered during the design phase. A typical detail is provided for an SVE chamber; the details about operation of the chambers will be decided during the design, if AS/SVE is selected. Geosyntec has designed SVE chambers with remote valving (typical at drycleaners where the chambers are installed beneath the drycleaner slab) and with valving within vault boxes. The specifics of the valving orientation associated with the SVE chambers is a design detail.*

# SZ Air Sparge and SVE Conceptual Design

- DPT groundwater sampling included (3 days)
  - To evaluate system optimization or shut down
- Minimum monthly O&M (daily for first three days, weekly first month, monthly thereafter)
- Performance monitoring
  - Installation of 10 monitoring wells
  - Quarterly monitoring for VOCs

# Response to Comments

TT Comments #3: Slide 28 (new slide 33) – Due to the nature of air sparging (AS) near occupied buildings, an ambient and soil vapor extraction (SVE) air sampling program should be integrated into the conceptual design (this comment is relevant for all AS alternatives). Please include this consideration and costs into the Step 2 EE.

*Response: We agree that an ambient air sparging program should be implemented, if AS/SVE is selected and implemented. A detailed description of the sampling plan will be provided in the Step 3 and costs are minimal and are considered to be included in the O&M cost provided.*

# SZ Air Sparge and SVE Conceptual Design Layout

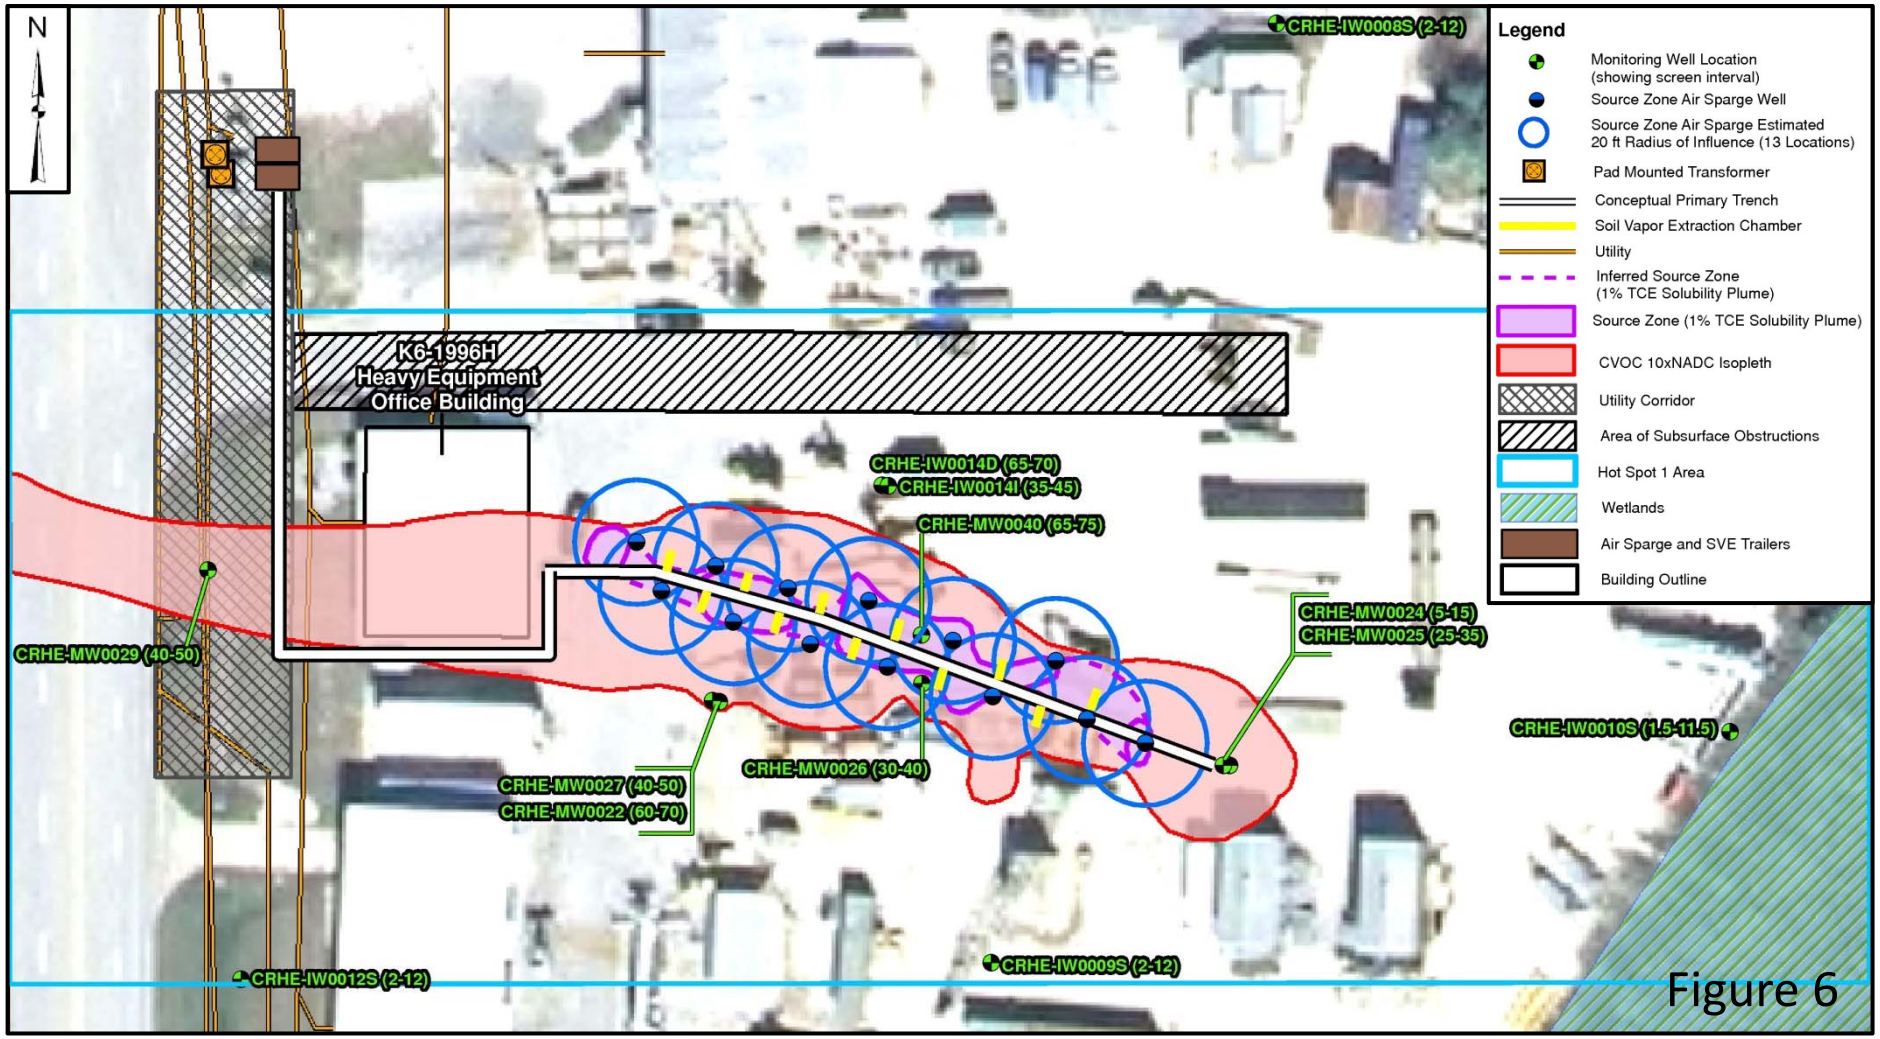

Figure 6

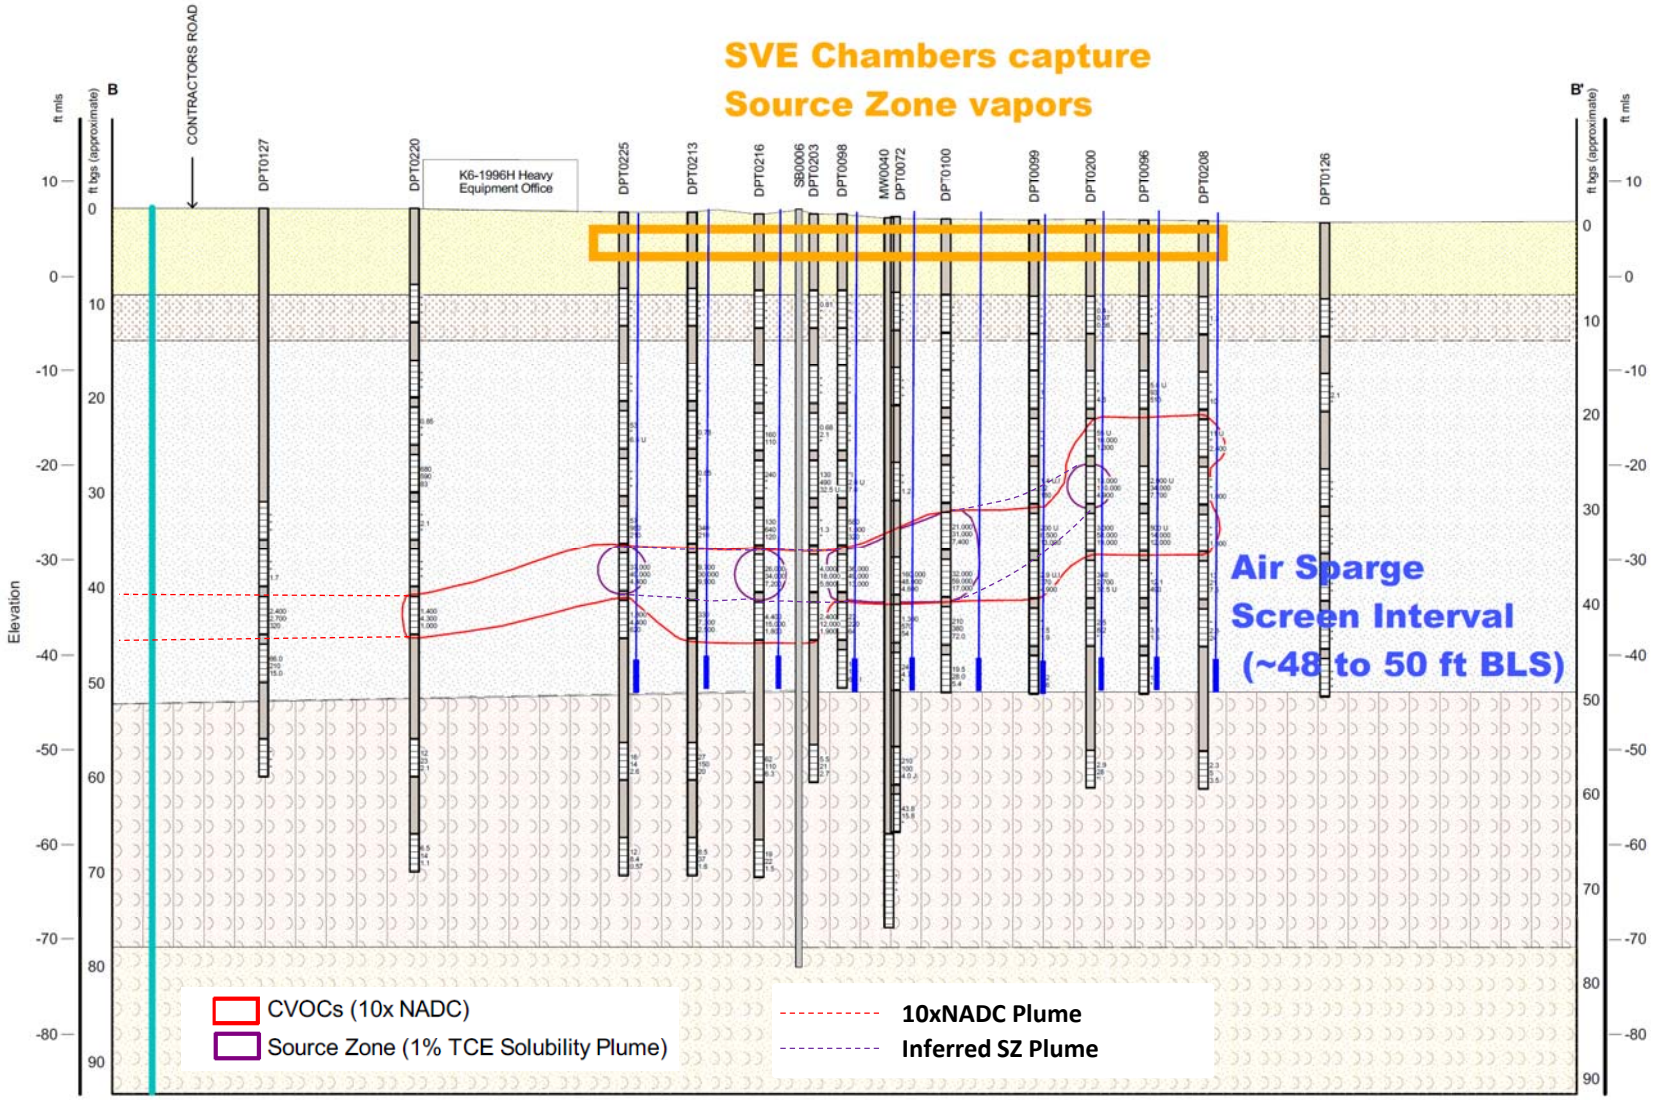
# SZ Air Sparge Conceptual Design Layout



# Response to Comments

TT Comment #4: Slide 30/36 – While the horizontal layout for the AS network is very conservative, it does not appear the vertical distribution of AS points is tailored to site conditions. In the source zone area near DPT0200, we suggest installing shallower AS wells or nesting wells to address the source zone at least 20 feet above the proposed screen intervals in order to provide a more focused approach (this comment is relevant for all source zone AS alternatives).

*Response: We feel that the current vertical layout is adequate for a conceptual design and the use of nested wells would be considered as part of the design, if AS/SVE is selected.*

Figure 8

# SZ Air Sparge and SVE Cost Summary

| SZ – AS and SVE | |
|---|---|
| Approximate Time to Achieve CAO | 2 to 3 years |
| Capital Cost Estimate | $252,900 |
| Annual O&M&M Cost Estimate | $96,200 |
| DPT Sampling Cost | $19,700 |
| Total Cost Estimate | $465,000 to $561,000 |

- CAO is conservative since treating area with probable DNAPL
  - Based on air sparge performance at other KSC sites
- Total cost estimate is cost to reach NADCs
  - Includes capital cost, DPT sampling, and two to three years of annual O&M&M
- Cost assumes the use of an existing mobile air sparge trailer

Table 1

# Response to Comments

Jacobs Comment #2: SZ Air Sparge and SVE: General – The site conceptual model includes probable DNAPL in the SZ. There is little literature regarding reduction of DNAPL by air sparging, so citations of applicable studies would be helpful in evaluating the estimate for the time to achieve the CAO and in evaluating the likelihood of rebound. We recognize that good information about air sparging performance in DNAPL source zones will be generated by the CCB Hot Spots 1 and 2 IM in the near future.

*Response: Based on the size of the source zone (0.04 acres – the non-inferred area), the likelihood of "pools" of DNAPL mass is relatively small. It is anticipated that the DNAPL mass present is likely smaller ganglia, which are easier to treat via AS. It has been documented that AS is a viable technology for sites that have low levels of DNAPL and LNAPL (not recoverable) as noted in the references below.*

- *Air Sparging Guidance Document (TR-2193-ENV) Naval Facilities Engineering Service Center, August 2001;*
- *Dense Nonaqueous Phase Liquids (DNAPL) Treatment Technologies (http://cluin.org/contaminantfocus/default.focus/sec/Dense_Nonaqueous_Phase_Liquids_%28DNAPLs%29/cat/Treatment_Technologies/) – developed by the EPA Ground Water Task Force.*
- *While not a specific literature reference, Geosyntec designed, installed, and operated an AS/SVE system at Lipham Cleaners in Longwood, Florida, which had PCE groundwater concentrations exceeding 10% of solubility (0.32 acres) and plume depth similar to CRHE (depth of sparge wells ~36 ft BLS). The AS operations at the site reduced groundwater concentrations to less than NADCs in 2.5 years.*

TT Comment #13: Cost Estimate, T-1 – The costs presented for a SVE system are significantly higher than what would be expected, considering the size of the system. Please clarify the $50,000 line item.

*Response: The cost for the SVE system was based off of vendor provided unit pricing (from Product Recovery Management) that includes the equipment trailer, blower, moisture separator with pump-out and controls, liquid-phase carbon, telemetry, delivery and start-up assistance. The estimated cost for the system, since the components have not been specifically selected was between $40,000 and $50,000, so the conservative $50,000 cost was utilized.*

TT Comment #14: Cost Estimate, T-1/T-2 – The electrical line installation line item cost appears low. Please revisit.

*Response: The cost for the electric line installation was scaled from the actual cost for the electric line installation performed in 2012 at VPF. The work at VPF included the installation of 50 feet of electric line and was approximately $5,000. Therefore, we felt that the identified line item cost was a conservative estimate for this Step 2, which assumed the installation of 30 ft of electric line.*

# Response to Comments

Jacobs Comment #3: SZ Air Sparge and SVE: General – Where there is DNAPL, the free phase product (TCE in this case) typically occupies a significant portion of available pore space. Air will seek the path of least resistance, so it seems likely that air-to-DNAPL contact will be low. What is the expected mechanism for reduction of DNAPL mass by air sparging? Please include your assumptions about degradation rate and effectiveness. It is important to understand these in order to evaluate and confirm estimates of time to achieve NADCs and cost.

*Response: DNAPL mass reduction via AS can occur via two mechanisms: (i) the volatilization of the DNAPL via direct contact with the air; and (ii) the dissolution of DNAPL into the groundwater as the dissolved concentrations are removed via volatilization. The rate for direct volatilization of the DNAPL would be comparable to rates observed at other sites where AS has been implemented. The rate for dissolution of DNAPL into the groundwater would be slower. The time to achieve the CAO was estimated to be the time to reduce CVOCs to NADCs and was based on air sparging results at other sites (one to two years) with time added for the dissolution of the DNAPL into groundwater.*

*It should be noted that the conceptual layout also included a very robust air sparge well network in the area of potential DNAPL to create an aggressive environment (20 foot spacing of AS wells). Operation of the system in this environment would include an aggressive dynamic approach to maximize air-to-DNAPL contact.*

# 1B – Air Sparge and SVE 10xNADC Plume

# 10xNADC Air Sparge and SVE Conceptual Design

- Installation of 34 AS wells via HSA
  - Screened from approximately 48 to 50 ft BLS
  - Five angle drilled AS wells beneath the building
  - Spacing in the source zone and under the building of approximately 20 ft and spacing of wells in 10XNADC ring approximately 30 feet (assumed 20 ft ROI)
  - 25-hp AS system operating one of three zones at a time
  - Use mobile air sparge trailer #3 (conservative 25 hp compressor)
    - Assumes electrical hookup available on site (transformer SS/USS-1103)
    - Capable of 190 scfm and 31.9 psi (estimated need ~ 30 psi to most distal well)
  - Anticipated flow rate of 5 to 10 scfm per well
- Purchase of SVE system – 16 SVE chambers installed to capture vapors in treatment area
  - 10-hp SVE system operating one of two zones at a time
  - GAC treatment of recovered vapors
  - SVE chambers (to maximize air flow) around the building and in the SZ
  - Anticipated flow rate of 20 to 30 scfm per chamber

# Response to Comments

Jacobs Comment #4: Alternative 1B, 10X NADC Plume Air Sparge and SVE: Slide 35 (new slide 46) – The conceptual plan calls for angular drilling to deploy AS wells under the building, with SVE wells positioned along the perimeter. Please confirm the influence of the perimeter SVE network is adequate to capture vapors from beneath the building.

*Response: The estimated ROI of the SVE system is between 20 ft and 30 ft (as described in the Description of Alternatives). The layout of the SVE wells with the estimated ROI should be adequate to cover the area underneath the building (approximate size of 70 by 50 ft) – see updated figure in the ADP with estimated ROI presented on slide 50. The layout is more than adequate for a conceptual design and associated costing and the exact details of the SVE layout will be evaluated during the design phase, if AS/SVE is selected.*

# 10xNADC Air Sparge and SVE Conceptual Design

- Hand auger to water table for well installation and hand dig for trenching in the utility corridor
- DPT groundwater sampling included (5 days)
  - To evaluate system optimization or shut down
- Minimum monthly O&M (daily for first three days, weekly first month, monthly thereafter)
- Performance monitoring
  - Installation of 15 monitoring wells
  - Quarterly monitoring for VOCs

Geosyntec consultants

# 10xNADC Air Sparge and SVE Conceptual Design Layout

# Response to Comments

TT Comment #6: Slide 38 (new slide 51) – Based on the presented ten times Natural Attenuation Default Criteria (10X NADC) plume, it is not clear what the AS wells to the western part of the cross section are treating and this interpretation does not match what is shown in plan view. We suggest revising the cross section to provide a closer correlation to the center line of the source zone/10X NADC plume (global comment).

*Response: The 10XNADC plume on the plan view is drawn by contouring the data on the west side of the building, which the cross section does not include. The 10XNADC contour has been updated on the cross sections in the presentation.*

Jacobs Comment #5: Alternative 1B, 10X NADC Plume Air Sparge and SVE: Slide 40 (new slide 54) – The plastic cap described in the Alternatives Description is not included in the SVE chamber detail. We suggest it be added.

*Response: A note was added to the ADP to provide information about the plastic cap on the SVE chamber detail. The specific engineering details of the plastic cap (which may not be warranted at all locations) is a design detail which would be included in the Interim Measure design, if AS/SVE is selected.*

# 10xNADC Air Sparge and SVE Summary

| 10xNADC – AS and SVE | |
|---|---|
| Approximate Time to Achieve CAO | 2 to 3 years |
| Capitol Cost Estimate | $424,600 |
| Annual O&M Cost Estimate | $121,200 |
| DPT Sampling Cost | $32,400 |
| Total Cost Estimate | $699,000 to $821,000 |

- CAO is conservative since treating area with probable DNAPL
  - Based on air sparge performance at other KSC sites
- Total cost estimate is cost to reach NADCs
  - Includes capital cost, DPT sampling, and two to three years of annual O&M&M
- Cost assumes the use of an existing mobile air sparge trailer
- Cost assumes purchase of trailer mounted SVE system Table 2

TT Comment #7: Slide 41 (new slide 55) – A pre-packaged SVE enclosure may be more appropriate and less expensive than a mobile trailer. We suggest evaluating the use of an enclosure instead of a trailer.

*Response: If AS/SVE is selected as the remedial alternative, these suggestions will be taken into consideration with NASA during the design phase.*

# 2A – Bioremediation SZ

# SZ Bioremediation Conceptual Design

- 29 DPT injection points
  - Electron donor injected from 20 to 50 ft BLS
  - Injection point spacing based on 8 ft ROI
- Injection of 33 drums of emulsified oil
  - Based on filling 0.5% of pore volume with emulsified oil
  - Conservative estimate based on possibility of DNAPL
- Second injection (17 drums) of emulsified oil 24 months after initial event
  - Based on filling 0.25% of pore volume with emulsified oil
- DPT sampling (3 days) included to aid in design for second injection event
- Installation of 10 performance monitoring wells
  - Sample all for VOCs quarterly
  - Analyze subset of 5 wells for *Dhc*, *vcrA*, sulfate, sulfide, and TOC

Jacobs Comment #8: Alternative 2A, SZ Bioremediation: Slide 43 (new slide 59) – Was a case study or information from one of your other sites used to develop the conceptual design of a 0.5% initial/0.25% follow-up pore volume emulsified oil application?

*Response: The emulsified oil dosing that we have used successfully during bioremediation implementation is between the range of 0.1% to 1% of the pore space and usually for dissolved phase plumes is around 0.1 to 0.2% of the pore space. The dosing of 0.5% and 0.25% was selected within that range and above the vendor's recommendation to be conservative.*

Jacobs Comment #9: Alternative 2A, SZ Bioremediation: Slide 43 (new slide 59)/Alternatives Description – We assume multiple lifts will be used to deliver emulsified oil through the treatment zone. What is the anticipated vertical area of influence for each lift?

*Response: Multiple lifts would occur to deliver the emulsified oil, continuously over the entire treatment interval. The anticipated vertical lift would be every 2 feet and emulsified oil and chase water would be injected to reach the desired ROI. The injection details will be decided during the design, if bioremediation is selected*

TT Comment #15: Description of Alternatives, Page 5 – The stated 60% oil substrate and 1:20 dilution results in an injection concentration of approximately 3%. Considering groundwater dilution and the suspected presence of DNAPL, the substrate dosage concentrations appear low. Please provide rationale for the bioremediation dosing.

*Response: The 1:20 dilution is within the recommend range of dilution from the vendor, so that the emulsion remains stable. See response to Jacob's comment #8 above for dosing information.*

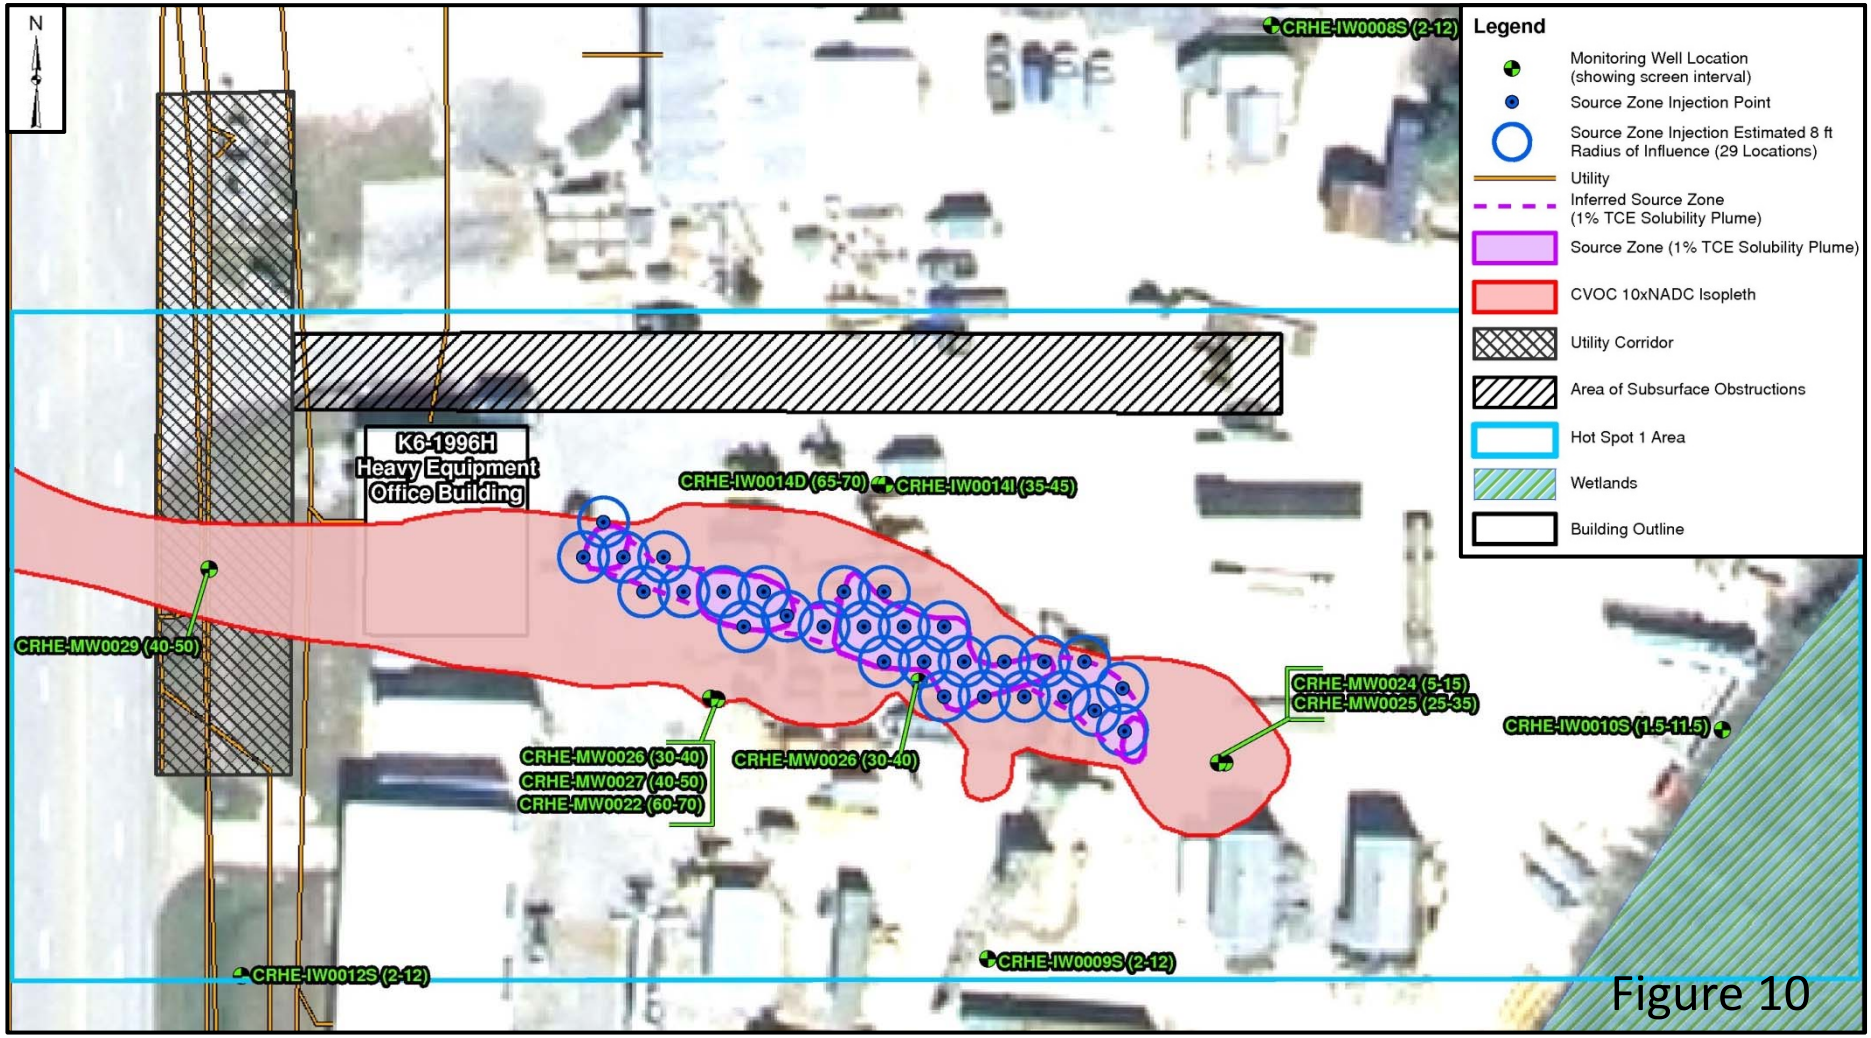

Figure 10

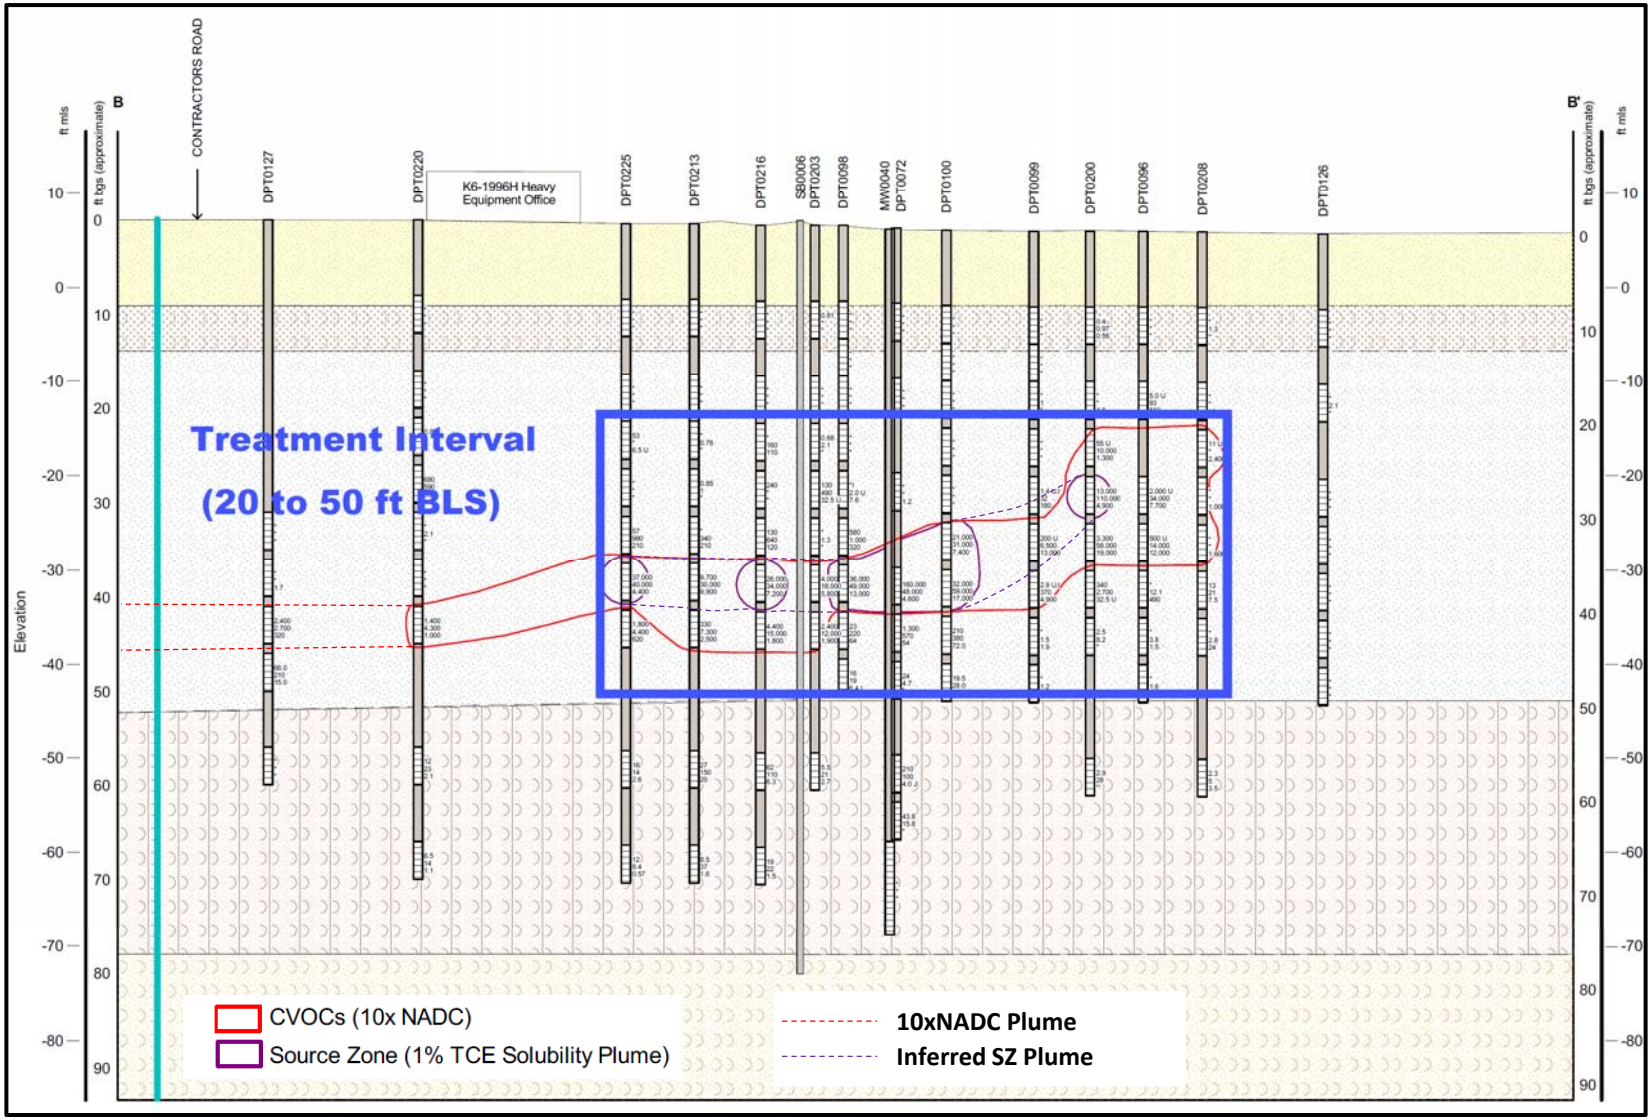
Geosyntec consultants

# SZ Bioremediation
# Conceptual Process Flow Diagram



TT Comment #8: Slide 45/50/56/61 (new slides 64/74/82/88) – Do the alternatives assume treatment of the entire area that is within the blue rectangle? If this is the case, the volumes used to calculate remedial additives may be substantially overestimated for treatment of the applicable plume interval. Please clarify.

*Response: AS/SVE will treat the entire interval from 20 ft to 50 ft; therefore, to compare the same treatment volume for all three technologies, the treatment interval for both enhanced bioremediation and EZVI was expanded to 20 to 50 ft BLS.*

# SZ Bioremediation Summary

| SZ – Bioremediation | |
|---|---|
| Approximate Time to Achieve CAO | 3 to 5 years |
| Capitol Cost Estimate | $167,400 |
| Annual O&M Cost Estimate | $60,000 |
| DPT Sampling Cost | $19,700 |
| Second Injection Cost Estimate | $69,900 |
| Total Cost Estimate | $437,000 to $557,000 |

- CAO is conservative since treating area with probable DNAPL
  - Based on MLP dechlorination rates from source area biostimulation
- Total cost estimate is cost to reach NADCs
  - Includes capital cost, DPT sampling, second injection event, and three to five years of annual O&M&M

Table 3

# Response to Comments

Jacobs Comment #10: Alternative 2A, SZ Bioremediation: Slide 46 (new slide 66) – Since the estimate of time to achieve CAO was based on MLP dechlorination rates, was a factor applied to account for the variance in TCE concentrations between the two sites?

*Response: A factor was not applied to account for the variance in concentrations between the two sites, since the TCE concentrations are similar – see response to Jacob's comment #6. TCE is generally not the rate limiting CVOC with regards to dechlorination (longest time to NADC); it is usually vinyl chloride. The time to reach CAO was based on the dechlorination rates for vinyl chloride from MLP. Using MLP rates, time to reach NADC for TCE was approximately 2 years, for cDCE was approximately 3.4 years and for vinyl chloride approximately 4.4 years; therefore, a range of 3 to 5 years was selected for this evaluation.*

Jacobs Comment #6: Alternative 2A, SZ Bioremediation: General – Emulsified oil is well-documented as a successful technology for enhanced reductive dechlorination of hot spots and areas affected by flux from DNAPL, particularly in aerobic environments, but literature regarding reduction of DNAPL mass is sparse. Citations of applicable studies would be helpful. We note the reference to the MLP/VAB Area and the successful treatment there, but also note that the highest TCE detection at that site was an order of magnitude below the highest detections at CRHE.

*Response: Bioremediation has been utilized at a number of DNAPL sites, including successful applications at three NASA sites where DNAPL has been present: LC34 (Demonstration of Biodegradation of DNAPL - 2004), LC34 Partitioning Electron Donor IM Hot Spot 1, and MLP (biostimulation using ethyl lactate). It should also be noted that at facilities where EZVI has been applied (LC34, Hangar K and Paris Island) collected data and documents indicate that the mass reduction is due to both abiotic and biotic reductive dechlorination.*

*With regards to TCE concentrations at MLP, TCE was measured at a maximum concentration of 95,000 µg/L from DPT location MLP-PT6 in 2002 and a maximum soil concentration of 102 mg/kg of TCE was detected (MLP-RTS1). The referenced concentrations are indicators of the presence of DNAPL. Concentrations of all CVOCs were reduced to below NADCs (TCE and cDCE to below GCTL) and VC is the only COC that remains above the GCTL.*

*The LC34 PED IM was implemented in an area with a maximum TCE concentration of 141,000 µg/L, an average TCE concentration of 22,000 µg/L, and a maximum soil concentration of 56.2 mg/kg TCE.*

*The LC34 (Demonstration of Biodegradation of DNAPL) initial TCE concentration of 132,000 µg/L to 350,000 µg/L and complete dechlorination to ethene was observed, with a TCE mass removal of 98.5%. Complete dechlorination occurred with up to 92 mg/L ethene production observed.*

*Based on the above data, the use of MLP dechlorination rates is adequate to estimate a time to reach CAO for CRHE.*

*Additionally, there is an Interstate Technology and Regulatory Council guidance document that consider the bioremediation of DNAPL source zones viable and provide case studies: In Situ Bioremediation of Chlorinated Ethene: DNAPL Source Zones (BIODNAPL) – June 2008.*

Jacobs Comment #7: Alternative 2A, SZ Bioremediation: General/Alternatives Description – Since contact with DNAPL is critical, please consider adding a discussion of the delivery mechanism for the emulsified oil. While the chase water will be beneficial in overall dispersion, it may be unlikely to enhance contact within DNAPL zones.

*Response: Direct contact of the oil with the DNAPL is not required for bioremediation to be successful. Mass removal of DNAPL during bioremediation is due to the microorganisms dechlorinating the CVOC mass (reducing concentrations) in the dissolved phase, which creates a concentration gradient and then dissolution of the DNAPL occurs. The emulsified oil will be delivered via DPT injection (6 to 8 gpm and 30 to 45 psi) and the chase water will be used to create the desired radius of influence from each injection point.*

# 2B – Bioremediation 10xNADC Plume

# 10xNADC Bioremediation Conceptual Design

- 107 DPT injection points
  - Electron donor injected from 20 to 50 ft BLS
  - Injection point spacing based on 8 ft ROI
  - Six angle-drilled injection points beneath the building
    - Avoiding angle drilling through utility corridor – only drilling from east side
  - Solar-powered groundwater recirculation system to increase flow beneath the building
  - Passive vents to avoid methane accumulation beneath the building
  - Hand auger to water table in utility corridor
  - MOT required, partially close Contractor's Road while injecting in the road
- Injection of 102 drums of emulsified oil
- DPT sampling (5 days) included to aid in design for second injection event
- Second emulsified oil injection 24 months after initial event (35 drums)
  - SZ: 50% original dose into all original locations
  - 10xNADC: 50% into half of the original locations
- Installation of 15 performance monitoring wells
  - Sample all for VOCs quarterly
  - Analyze subset of 8 wells *Dhc*, *vcrA*, sulfate, sulfide, and TOC
  - Sampling the injection and extraction wells to aid in evaluation of mass removal under building

Geosyntec consultants

# 10xNADC Bioremediation Conceptual Design Layout

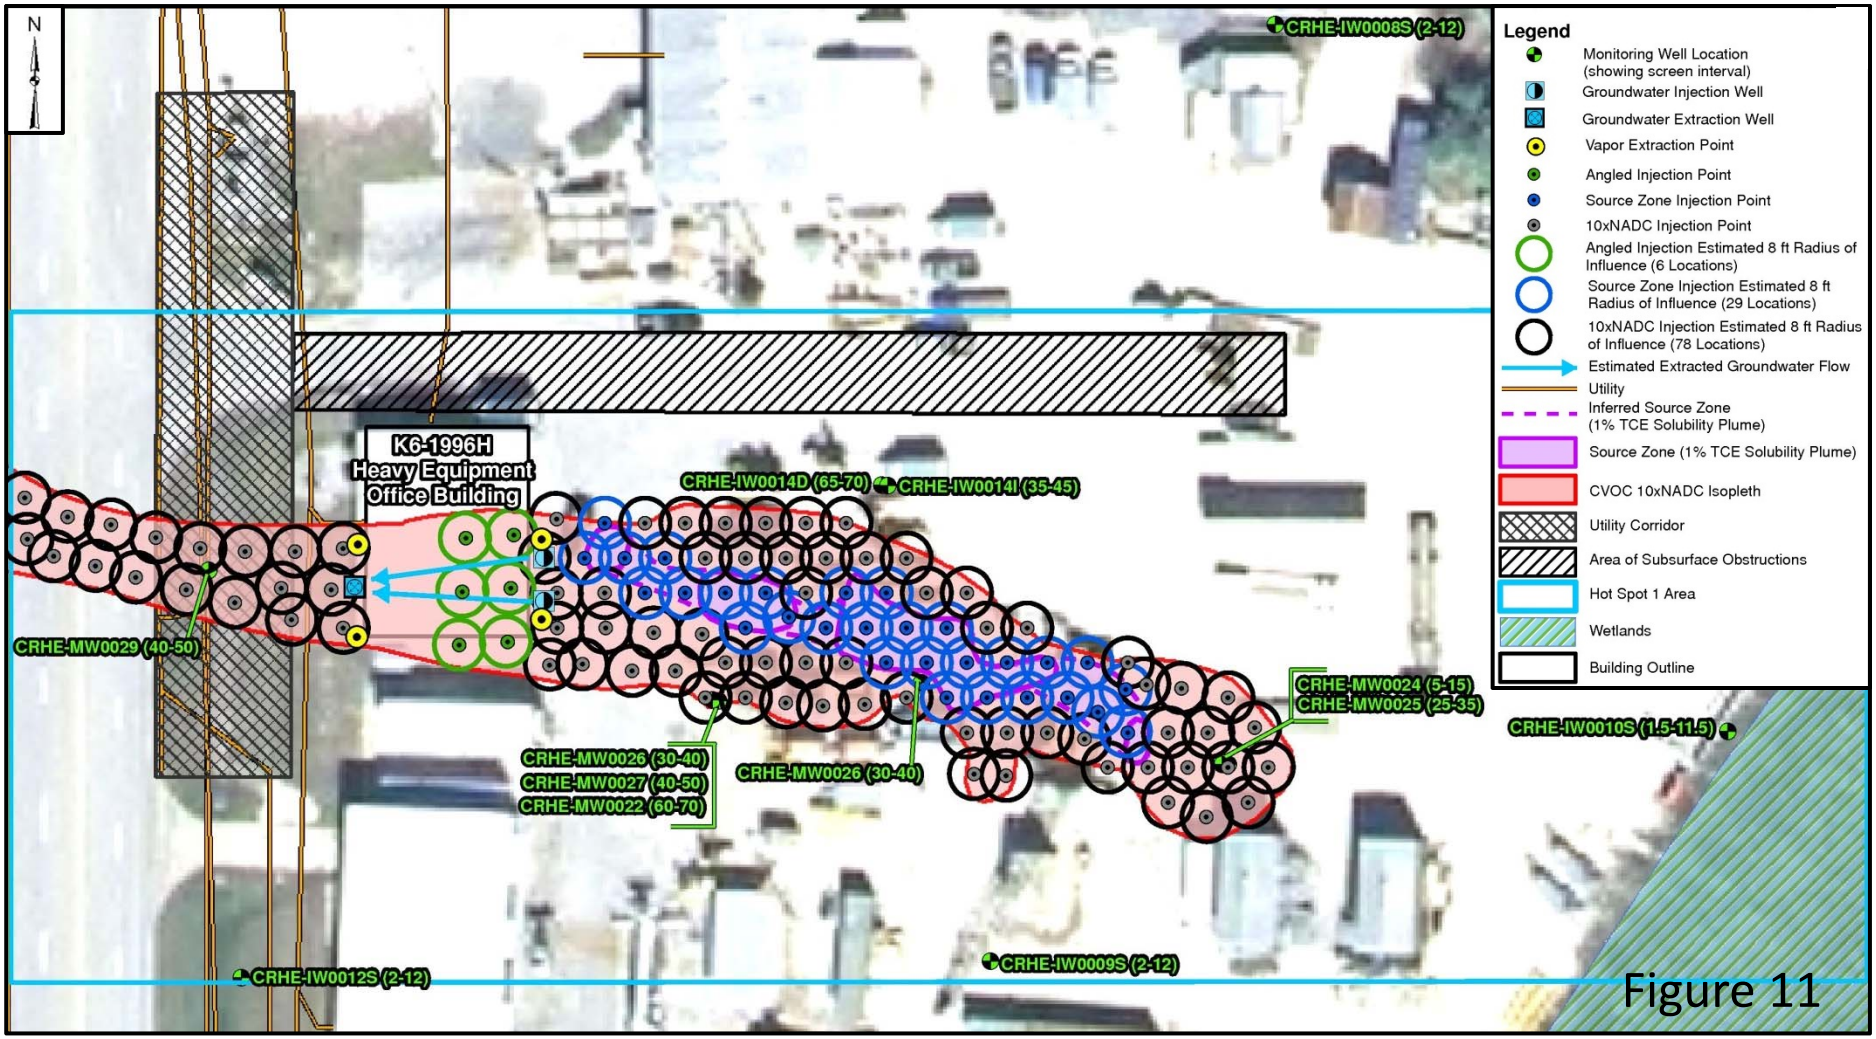


Figure 11

TT Comment #9: Slide 49 (new slide 72) – The passive vents, as currently placed, do not clearly appear to provide protection of methane accumulation underneath the structure. Furthermore, will the venting cause secondary issues such as odor? We recommend the methane venting approach be revised.

*Response: We feel that the passive venting system is adequate for a Step 2 evaluation. The vents provide a path for any methane produced to be discharged at the roof level to the atmosphere. During the design phase, an evaluation would be performed if active venting is recommended (could add a radon type electric or solar fan, or a wind turbine to the vent stack to make the system active). It is unlikely that the passive venting will cause any secondary issues. The approach proposed has been implemented at a number of bioremediation project sites in Florida without secondary odor issues.*

# 10xNADC Bioremediation Summary

| SZ – Bioremediation with Recirculation | |
|---|---|
| Approximate Time to Achieve CAO | 3 to 5 years |
| Capitol Cost Estimate | $440,500 |
| Annual O&M Cost Estimate | $99,500 |
| DPT Sampling Cost | $32,400 |
| Second Injection Cost Estimate | $158,200 |
| Total Cost Estimate | $930,000 to $1,129,000 |

- CAO is conservative since treating area with probable DNAPL
  - Based on MLP dechlorination rates from source area biostimulation
- Total cost estimate is cost to reach NADCs
  - Includes capital cost, DPT sampling, second injection event, and three to five years of annual O&M&M

Table 4

# 3A – EZVI SZ

# SZ EZVI Conceptual Design

- 126 DPT injection points
  - 5% EZVI (sizes ranging from 0.1 to 5 microns) by weight
    - Used at Hangar K site at CCAFS
  - Approximately 20,500 gallons of EZVI
    - Based on filling 10% of pore space
  - EZVI injected from 20 to 50 ft BLS
  - Injection point spacing based on estimated 3 ft ROI
- Second EZVI injection event 24 months after initial event (50% the initial injection volume - 10,250 gallons)
- DPT sampling (3 days) included to aid in design of second injection event
- Installation of 10 performance monitoring wells
  - Sample all for VOCs quarterly

Geosyntec consultants

# Response to Comments

Jacobs Comment #11: Alternative 3A, SZ EZVI: Slide 54 (new slide 78)/Alternatives Description – What injection technique did Vironex use for development of the conceptual design? Will that technique be able to access the DNAPL pore space? Note that at Hangar K, a 6-ft. ROI was achieved using the Badger© technology. (A 6-ft ROI was also assumed in the recent injections at the GSA Reclamation Yard, but we won't have confirmation of the ROI until the first performance monitoring event.) We are concerned both that the 3-ft. ROI assumed may be overly conservative, but – at the same time – injection cost may be understated since the injection technique is not described.

*Response: Vironex uses a high-performance double piston pump to inject EZVI, top down, at approximately 50 gpm to achieve lateral distribution of EZVI. The high frequency piston action of the pump helps to distribute the EZVI throughout the pore space to achieve contact with the DNAPL. Each injection interval is separated by 2 ft to help minimize creation of vertical flow paths.*

*The estimated 3 ft ROI was conservative, so we have also provided a less conservative costing based on an estimated 6-ft ROI. It should be noted that our definition of ROI involves achievement of complete distribution of injectate throughout the desired target interval (not an indicator of a seam of EZVI at 6 ft); accordingly, we used a more conservative 3 ft ROI since the ZVI component is dependent on contact to achieve the desired abiotic reductions intended to target DNAPL. This non-conservative costing resulted in a capital cost range of $673,000 to $734,000 and the second injection cost ranged from $306,000 to $336,000 (total cost reduction of $90,000). For the source zone, this would reduce the cost range from $1,240,000 to $1,340,000 to $1,149,000 to $1,249,000. For the 10X NADC area, this would reduce the cost range from $1,718,000 to $1,883,000 to $1,628,000 to $1,793,000. The cost driver for EZVI is the purchase of the material (~$700,000 for two injection events); accordingly, the less conservative 6 ft ROI does not have a significant bearing on the range of costs.*

TT Comment #10: Slide 54/59 (new slide 78/86) – The injection radius of influence (ROI) of 3 feet is very conservative and may bias the costs of emulsified zero-valent iron (EZVI) alternatives. We suggest the spacing be revisited.

*Response: The costing was updated to evaluate a non-conservative 6 ft ROI and is included in the response to Jacobs' comment #11 above.*

Geosyntec consultants

# SZ EZVI
# Conceptual Design Layout

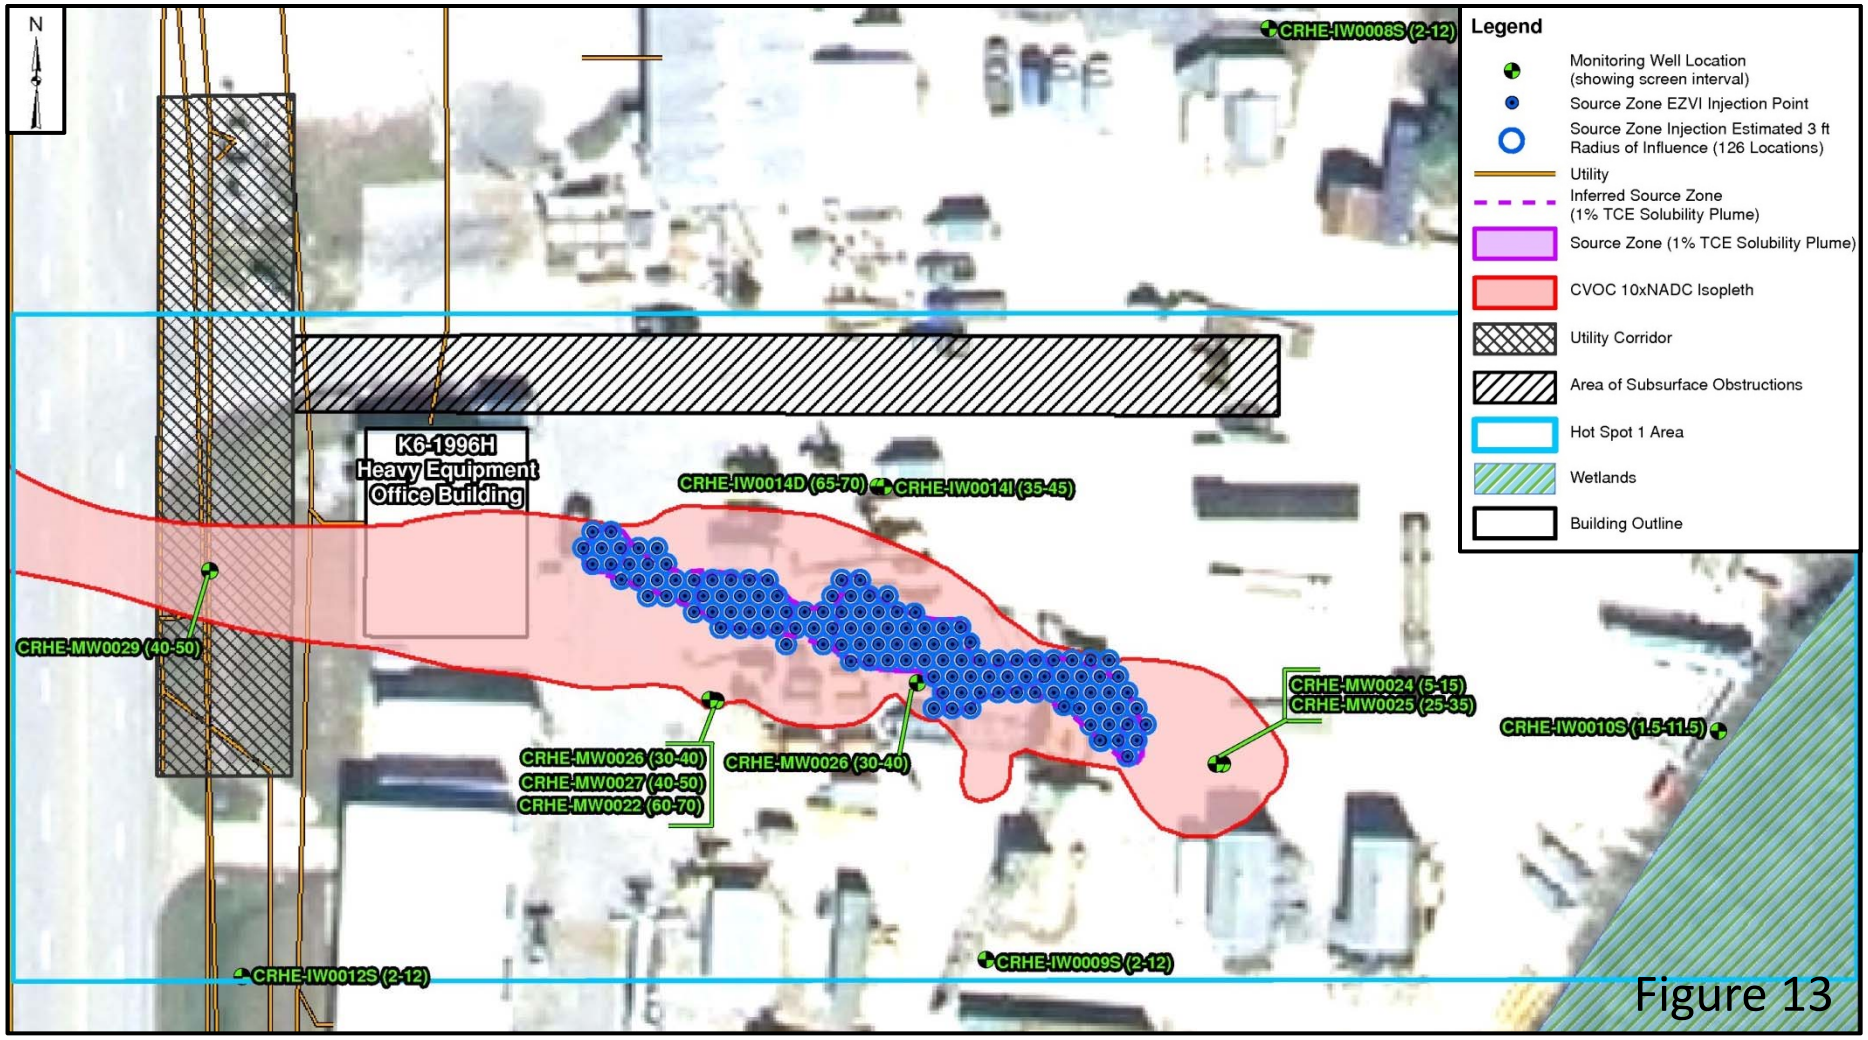

Figure 13

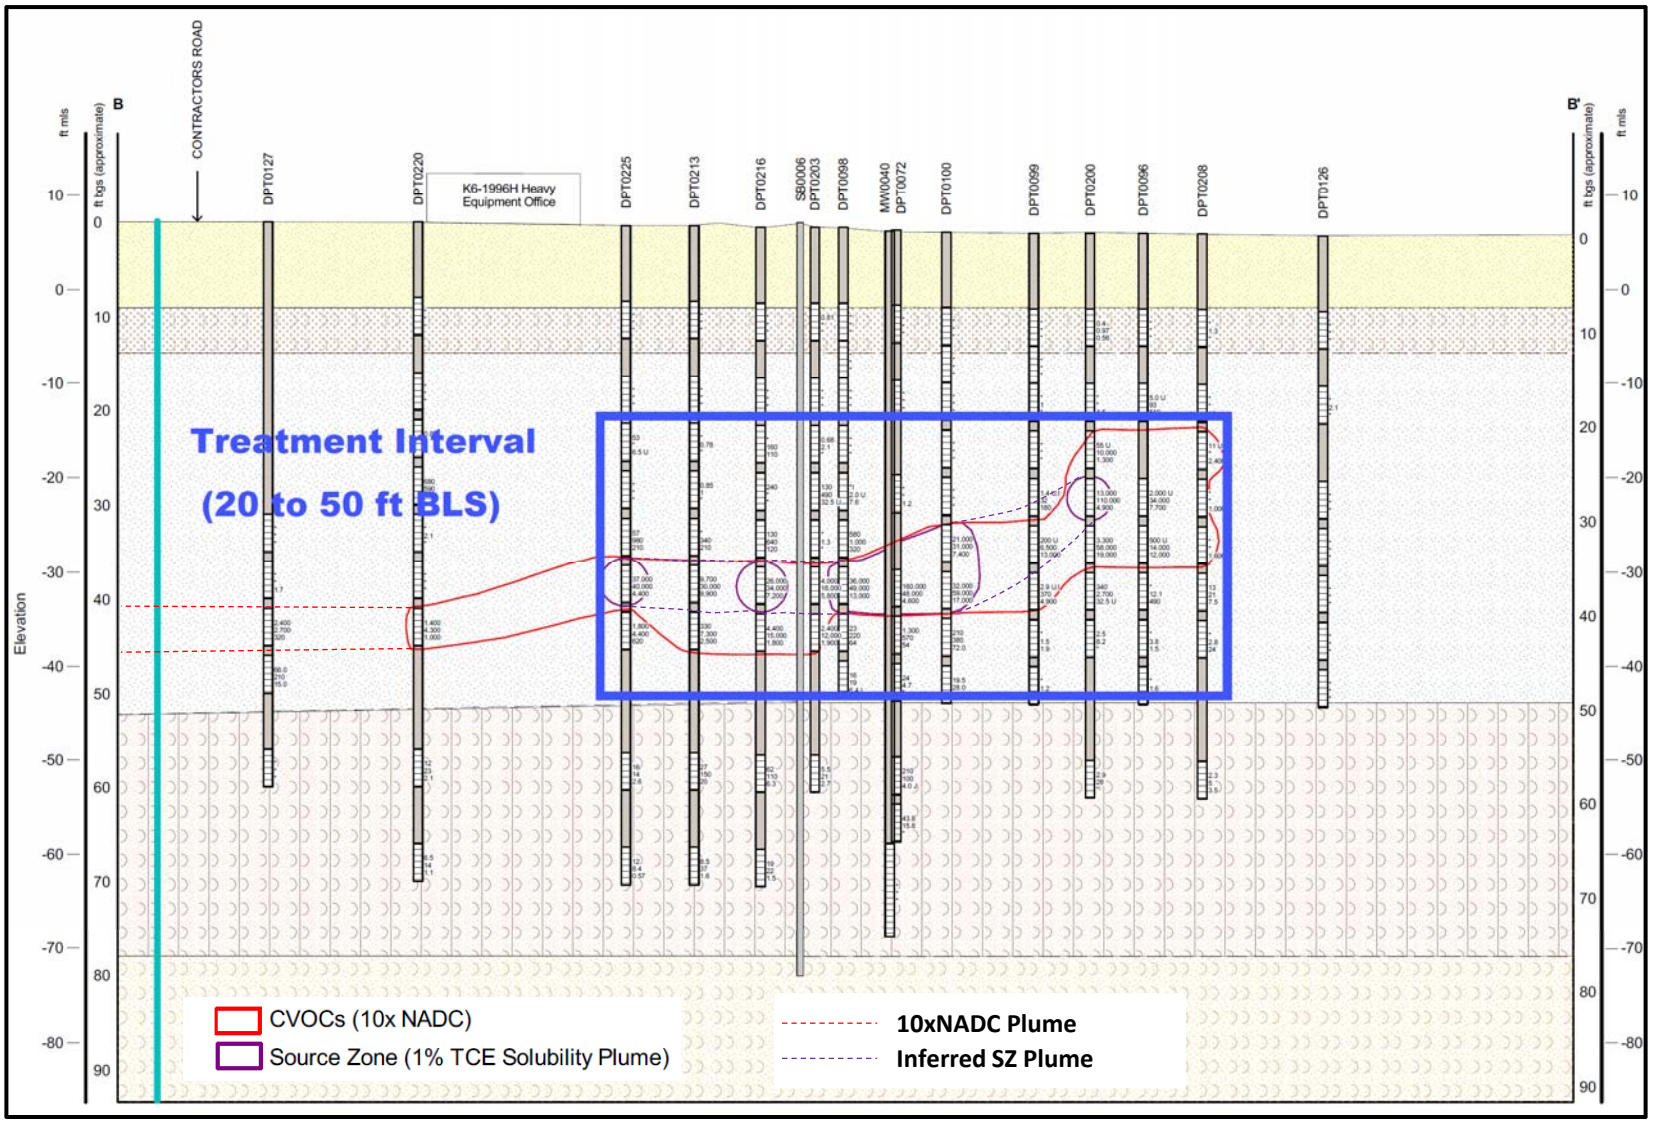
# SZ EZVI
# Conceptual Design Layout



# SZ EZVI Summary

| SZ – EZVI | |
|---|---|
| Approximate Time to Achieve CAO | 3 to 5 years |
| Capitol Cost Estimate | $734,100 |
| Annual O&M Cost Estimate | $50,000 |
| DPT Sampling Cost | $19,700 |
| Second Injection Cost Estimate | $335,800 |
| Total Cost Estimate | $1,240,000 to $1,340,000 |

- CAO is conservative since treating area with probable DNAPL
  - Based on results from Hanger K
- Total cost estimate is cost to reach NADCs
  - Includes capital cost, second injection event, and three to five years of annual O&M&M

Table 5

# Response to Comments

Jacobs Comment #12: Alternative 3A, SZ EZVI: Slide 57 (new slide 83) – Regarding time to achieve CAO based on results from Hangar K: At Hangar K, TCE concentrations were reduced by 88% six months after the first injection. After a pre-programmed second injection and a total elapsed time of 18 months from the first injection, TCE concentrations were reduced by 99%. It does not appear that NADC for all chlorinated VOCs will be reached within 5 years.

*Response: The concentrations at Hangar K were higher and the impacted area was larger than what is observed at CRHE; two 200 ppm TCE plumes were delineated that were approximately 3,000 and 6,200 square feet (with impacts from ~ 30 to 52 ft BLS).*

*To reduce the average CVOC concentrations to their NADCs in the SZ, a reduction in mass of 98.4% (VC), 98.5% (cDCE), and 99.6% (TCE) is required. If the removal is based on the maximum concentrations, a concentration reduction of 99.8% (TCE), 99.4% (cDCE) and 99.5% (VC) is required. Based on the site conditions, we believe a 5 year timeframe is adequate for these reductions.*

# 3B – EZVI and Bioremediation with Recirculation 10xNADC Plume

# SZ EZVI and 10xNADC Bioremediation Conceptual Design

- EZVI in the Source Zone – same as Alternative 3A
  - 5% EZVI (sizes ranging from 0.1 to 5 microns) by weight
  - Approximately 20,500 gallons of EZVI
  - EZVI injected from 20 to 50 ft BLS
  - Injection point spacing based on 3 ft ROI
- Bioremediation in the 10xNADC – same as 10xNADC area in Alternative 2B
  - 78 DPT injection points
  - Injection point spacing based on 8 ft ROI
  - Six angle-drilled injection points beneath the building
  - Solar-powered groundwater recirculation system to increase flow beneath the building
  - Passive vents to avoid methane accumulation beneath the building
  - Hand auger to water table in utility corridor
  - MOT required, partially close Contractor's Road while injecting in the road
- DPT sampling (5 days) included to aid in design of second injection event
- Second injection 24 months after initial event (SZ: 50% initial injection volume, 10xNADC with 50% into half of the original locations)
- Installation of 15 performance monitoring wells
  - Sample all for VOCs quarterly
  - Analyze subset of 3 wells for *Dhc, vcrA*, sulfate, sulfide, and TOC
  - Sampling of injection and extraction wells to evaluate mass removal under building

# SZ EZVI and 10xNADC Bioremediation Summary

| SZ – EZVI and Bioremediation with Recirculation | |
|---|---|
| Approximate Time to Achieve CAO | 3 to 5 years |
| Capitol Cost Estimate | $1,009,700 |
| Annual O&M Cost Estimate | $82,500 |
| DPT Sampling Cost | $32,400 |
| Second Injection Cost Estimate | $428,400 |
| Total Cost Estimate | $1,718,000 to $1,883,000 |

- CAO is conservative since treating area with probable DNAPL
  - Based on Hangar K results
- Total cost estimate is cost to reach NADCs
  - Includes capital cost, second injection event, and three to five years of annual O&M&M

Table 6

Jacobs Comment #14: Alternative 3B, 10X NADC Plume EZVI and Bioremediation with Recirculation: Slide 63 (new slide 90) – Similar to the note regarding Slide 57: At Hangar K, the HCP was treated using emulsified vegetable oil and lactate. Early indications are that the dissolved plume's decay has accelerated through the combination of SZ and HCP treatment, but it does not appear that NADC for all chlorinated VOCs will be reached within 5 years.

*Response: The calculation of time to reach NADC for each CVOC using enhanced bioremediation was based on MLP dechlorination rates and we feel this is an appropriate approximation.*

# Response to Comments

Jacobs Comment #13: Alternative 3B, 10X NADC Plume EZVI and Bioremediation with Recirculation: General – EZVI was engineered specifically as a DNAPL technology. Consider reducing the footprint of the EZVI application in the inferred SZ. When using EZVI in combination with technologies that enhance biological degradation, please consider applying EZVI only in the zones where the TCE concentrations exceed 10% of solubility. At Hangar K, EZVI was applied in zones where TCE concentrations were ≥200 ppm.

*Response: There are only two locations at CRHE with TCE concentrations near 10% TCE solubility (110,000 µg/L): DPT0072 from 36 to 40 ft BLS (160,000 µg/L) and DPT0134 from 36 to 40 ft BLS (100,000 µg/L); therefore, adjusting the treatment area to encompass the 10% solubility would create a small treatment area. The footprint for EZVI injection was agreed upon in the Step 1 to evaluate the implementation in the area where TCE is greater than 1% solubility. A reduction of the vertical treatment interval, currently from 20 to 50 ft BLS, can be evaluated during the design phase, by utilizing the DPT sampling data to reduce the vertical treatment interval.*

| Alternative | | Advantages | Disadvantages | Limitations | Expectations | Sustainability |
|---|---|---|---|---|---|---|
| 1A | Air Sparge and Soil Vapor Extraction in SZ | Demonstrated technology at nearby sites; local site geology well understood; short duration anticipated (<3 years). | Energy intensive; high O&M; potential for offsite plume migration. | Heavy equipment on site - equipment wheel loads could require specialized vault boxes and trenching design. | Rapid volatilization of CVOCs to less than NADCs achieved in 3 years or less. | Short cleanup timeframe, reusable treatment system, significant power and O&M requirements. Trenching and infrastructure installation required. |
| 1B | Air Sparge and Soil Vapor Extraction in 10xNADC | Demonstrated technology at nearby sites; local site geology well understood; short duration anticipated (<3 years). | Energy intensive; high O&M; potential for offsite plume migration. | Heavy equipment on site. Weight of equipment may damage air sparge wells, SVE Chambers and/or piping. Occupied building requires angled drilling and vapor treatment. Congested utility corridor requires hand digging to water table. | Rapid volatilization of CVOCs to less than NADCs achieved in 3 years or less. | Short cleanup timeframe, reusable treatment system, significant power and O&M requirements. Trenching and infrastructure installation required. |
| 2A | Bioremediation - Biostimulation using emulsified oil in SZ | Passive in situ approach; low O&M cost; demonstrated technology in other areas of KSC with similar lithology/constituents. Aquifer conditions are anaerobic. Limited treatment footprint with no infrastructure installation. | Large number of injection locations required, potential for additional injections beyond those budgeted, and potential for incomplete dechlorination. | Possibility of DNAPL present and slower dechlorination rates. | Reductive dechlorination of CVOCs to ethene within 3 to 5 yrs. | In situ technology with no monthly O&M or electrical power requirements. |
| 2B | Bioremediation - Biostimulation using emulsified oil in 10xNADC | Passive in situ approach; low to medium O&M cost; demonstrated technology in other areas of KSC with similar lithology/constituents. Aquifer conditions are anaerobic. | Large number of injection locations required, potential for additional injections beyond those budgeted, and potential for incomplete dechlorination. O&M required for recirculation wells. | Occupied building requires angled drilling and vapor treatment. Congested utility corridor requires hand digging to water table. | Reductive dechlorination of CVOCs to ethene within 3 to 5 yrs. | In situ technology. Solar powered - low electrical demand. |

# Technology Comparison

| Alternative | | Advantages | Disadvantages | Limitations | Expectations | Sustainability |
|---|---|---|---|---|---|---|
| 3A | EZVI in SZ | Passive in situ approach with low O&M cost. Limited treatment footprint. Expected biodegradation of COCs. | Large number of injection locations required, potential for additional injections beyond those budgeted, and potential for incomplete dechlorination. | Contact is important for success of this technology; distribution via injection could be problematic. | Abiotic reductive dechlorination of CVOCs to ethene within 3 to 5 yrs. | In situ technology with no monthly O&M or electrical power requirements. |
| 3B | EZVI with Bioremediation - EZVI in SZ and biostimulation using emulsified oil in 10xNADC | Passive in situ approach; low O&M cost; demonstrated technology in other areas of KSC with similar lithology/constituents. Aquifer conditions are anaerobic. Limited treatment footprint for EZVI. | Large number of injection locations required, potential for additional injections beyond those budgeted, and potential for incomplete dechlorination. O&M required for recirculation wells. | Occupied building requires angled drilling and vapor treatment. Congested utility corridor requires hand digging to water table. | Abiotic reductive dechlorination of CVOCs to ethene within 3 to 5 yrs. | In situ technology. Solar powered - low electrical demand. |

Table 7

# Technology Cost Comparison
# Source Zone Treatment

| Alternative | | Total "Pay as You Go" Cost (Active Remediation) | Estimated CVOC Mass Removed | Estimated Cost per Pound of CVOC Mass Removed |
|---|---|---|---|---|
| Units | | $ | lbs | $/lbs |
| 1B | 10xNADC AS/SVE | $700,000 | 152 | $4,600 |
| | | $820,000 | | $5,400 |
| 2B | 10xNADC Bioremediation | $930,000 | 152 | $6,100 |
| | | $1,130,000 | | $7,400 |
| 3B | SZ EZVI 10xNADC Bioremediation | $1,720,000 | 152 | $11,300 |
| | | $1,880,000 | | $12,400 |

Mass removed is estimated mass based on reducing concentrations to NADC in the treatment areas

Table 7

Jacobs Comment #15: Technology Comparison and Technology Cost Comparisons – For SZ Alternatives 1A (air sparging) and 2A (emulsified oil), we are concerned that the lack of documented performance history for these technologies for DNAPL treatment may result in some understatement of both the estimated time to achieve CAO and the treatment cost. Treatment success at CRHE will largely depend on the amount of DNAPL present and how efficiently that DNAPL mass is removed or controlled. Inclusion of applicable site or study information would be very helpful.

*Response: See responses to comment #2 and #6 above.*

TT Comment #12: Cost Estimate, Global Comment – The cost estimates do not clearly identify if direct or burdened costs are presented in the Step 2 EE. Please clarify.

*Response: The cost estimates are fully burdened.*

# Response to Comments

TT Comment #11: Slide 71 (new slide 104) – Prior to concurring with the selection of bioremediation, we suggest that the EZVI alternatives be revisited per Comment 10. Although there is limited case study literature available regarding the efficacy of bioremediation of dense non-aqueous-phase liquid (DNAPL), the limitations of bioremediation may be understated in this ADP. Additionally, we suggest screening bioremediation substrates that contain ZVI as a supplement to the bioremediation alternatives.

*Response: The costing was revised using a 6 ft ROI and is included in the response to Jacob's comment #11 above. See comment #6 for discussion of bioremediation in DNAPL source zones. We feel that emulsified oil is the best substrate for implementing bioremediation at this site.*

# Technology Evaluation Summary

- All three technologies are capable of treating COCs
- Why not air sparging?
  - Trenching at an active facility with large pieces of equipment and personnel that work in the area
  - Heavy equipment will likely require specialty vault boxes and geotech evaluation for trenching
  - Likely mounding from AS and possible entrainment issue with SVE
  - Scale up/expansion issues (when looking at plume as a whole) – due to presence of road/railroad yard and woods/wetland
  - Engineering solutions can be developed, but there are risks
- Why Bioremediation?
  - Passive implementation
  - Ideal geochemistry
  - Reduced O&M&M (monitoring only)
  - Amenable to scaling
  - More cost effective than EZVI

# Path Forward

- Recommend bioremediation of the source zone
  - AS/SVE is less expensive per pound and total "Pay as You Go", but bioremediation offers:
    - A more passive technology at a busy site
    - Reduced impact to operations
    - Reduced risk of damage to utilities or to the treatment system during operation
    - Reduced risk of failure – AS/SVE mounding likely to cause entrainment issues for SVE with potential exposure to personnel
- Test consensus

# CONTRACTOR'S ROAD HEAVY EQUIPMENT AREA: HOT SPOT 1
# DESCRIPTION OF ALTERNATIVES

## OVERVIEW

The Contractor's Road Heavy Equipment (CRHE) Area Step 1A and 1B Engineering Evaluation Advanced Data Packages (ADPs) for Hot Spot 1 were presented at the December 2013 Kennedy Space Center Remediation Team meeting. During the Step 1 Engineering Evaluation, the source zone was defined as the area with concentrations of trichloroethene (TCE) greater than 11,000 micrograms per liter (µg/L). Based upon the proximity of adjacent source zone contours, the separately contoured areas were combined to form an overall source zone area for the evaluation of remedial technologies as presented on **Figure 1** (of the ADP). The source zone is approximately 0.07 acres (3,050 square feet) and is located east of the Heavy Equipment Office Building (K6-1996H).

The ten times Natural Attenuation Default Concentration (10xNADC) area is defined as the area with groundwater TCE, *cis*-1,2-dichloroethene (cDCE), and vinyl chloride (VC) concentrations greater than ten times their respective NADC. The 10xNADC plume encompasses the source zone and extends west beneath the Heavy Equipment Office Building (M6-1996H), a utility corridor, and Contractor's Road. The western portion of the 10xNADC plume is defined by the Hot Spot 1 boundary, located at the west edge of Contractor's Road. The 10xNADC plume is approximately 0.44 acres (19,000 square feet). The area within the 10xNADC plume that does not include the source zone is referred to as the 10xNADC ring.

Based on the Step 1B, aggressive treatment technologies retained for further evaluation for the source zone consisted of:

- air sparging/soil vapor extraction (AS/SVE);
- bioremediation; and
- emulsified zero valent iron (EZVI) injection.

Aggressive treatment technologies retained for further evaluation of the 10xNADC area consisted of:

- AS/SVE;
- bioremediation; and
- EZVI injection in the source zone/bioremediation of the 10xNADC ring.

Additionally, institutional controls were retained for all remedial alternatives.

The Corrective Action Objective (CAO) used in this evaluation is to reduce TCE, cDCE, and VC concentrations to less than NADCs or concentrations which will facilitate a transition to natural

attenuation monitoring (NAM). Descriptions of the treatment technologies and conceptual designs are provided in the following sections.

## AIR SPARGING / SOIL VAPOR EXTRACTION - OVERVIEW

Air sparging is a proven technology at KSC sites that entrains contaminants in air injected into the subsurface. Volatilized contaminants are released to the atmosphere or collected using an SVE system (because of the mass present in the subsurface and presence of nearby structures and personnel).

For each air sparging scenario considered, the system would include the hollow stem auger installation of 2-inch diameter schedule 40 PVC air sparge wells to a total depth of 50 ft below land surface (BLS) with a 20″ Schumasoil well screen installed from approximately 48 to 50 feet BLS. The air sparge wells would transition to 1- inch diameter galvanized steel pipe approximately 12 inches below grade. Wells would be completed flush with land surface with a 16-inch diameter steel manhole or 18″ x 18″ x 24″ steel vault box set in a concrete pad. The well head at each air sparge well would include a gate valve and a check valve. Upstream of the well head the piping would transition to SCH 80 PVC that would be buried at least 24 inches below grade. The PVC piping would run from the sparge wells to the manifold, which would house pressure gauges and flow meters for each well. The piping from the manifold would run to the equipment trailer, located near an electrical transformer, where the piping would transition to galvanized steel for the above ground connections to the trailer. Both air sparge scenarios assume the use of an existing air sparge trailer, which would alternate operation of two or three zones.

In consideration of the existing structures, workers, and NASA request, an SVE system is proposed to protect personnel working in the area and to alleviate the potential accumulation of contaminants in the vapor phase beneath the building (which could result in a release of vapor to indoor air). The new, trailer mounted, minimum 10-horsepower blower will be piped below grade to a network of SVE chambers located at approximate 20 foot intervals around the building and through the source zone. The chambers will be constructed of 4-inch diameter slotted PVC pipe laid in a 1-ft x 2-ft x 5-ft "chamber" lined with filter fabric and filled with pea gravel. The greater surface area (compared to that provided by a standard SVE well) will allow for greater airflow at a lower vacuum, increasing the SVE system effectiveness. To aid in the effectiveness of the SVE system, a plastic cap will be installed over the treatment area to prevent water infiltration, reduce emissions of fugitive vapors, prevent vertical short-circuiting of air flow, and to increase the design ROI. Off-gases would be treated using vapor-phase granular activated carbon (GAC).

In addition to the installation of the air sparge/SVE system, performance monitoring wells would be installed using direct push technology (DPT) drilling to supplement the existing monitoring well network at the site. Each scenario includes quarterly sampling of the newly installed performance monitoring well network (10 or 15 monitoring wells) for chlorinated volatile organic compound

(CVOC) analysis. AS/SVE is expected to meet the CAO within two to three years based on experience at other sites at KSC and in Florida.

Included in the air sparge evaluation is DPT groundwater sampling (three or five days) to aid in evaluation of air sparge system optimization or to aid in evaluation of shutting down the system.

***Air Sparging/Soil Vapor Extraction – Source Zone***

Air sparging in the source zone would include the installation of an estimated 13 vertical air sparge wells, as described in the previous section. Air sparge wells would be spaced conservatively (approximately 20 feet between wells), with an estimated 20-ft radius of influence (ROI), allowing for a robust overlap of influence from adjacent wells. The spacing of the air sparge wells was more conservative, since the presence of dense non-aqueous phase liquid (DNAPL) is possible. The specific number and spacing of the air sparge wells would be refined in the interim measure (IM) design.

The SVE system would be constructed with an estimated 11 chambers as described in the previous section. The radius of influence expected from the SVE system is approximately 20 to 30 ft as observed at other Florida sites with similar vadose zone lithology. Operation and maintenance would be performed on the AS/SVE system for the first three days of operation, weekly for the remainder of the first month of operation, and monthly thereafter.

Up to 10 performance monitoring wells would be installed, using DPT drilling, to supplement the existing monitoring well network at the site. The performance monitoring network (10 monitoring wells) would be sampled quarterly for chlorinated volatile organic compounds (CVOCs).

***Air Sparging/Soil Vapor Extraction – 10xNADC Area***

Air sparging in the 10xNADC Area would include the installation of an estimated 29 vertical air sparge wells and five angle-drilled wells. AS/SVE of the 10xNADC area involves the following design constraints and implementation considerations:

- Vertical air sparge wells cannot be readily installed beneath the Heavy Equipment Office Building (K6-1996H) because it is currently in use by personnel; therefore, the following approach was utilized for the feasibility study evaluation and layout:
    - angle-drilled air sparge wells (five) installed via sonic drilling methods from land surface east of the building (to avoid drilling in the utility corridor) beneath the building to aid in air distribution; and
    - SVE chambers along the building's exterior walls to avoid accumulation of potential vapors beneath the occupied building.

- Utilities in the corridor east of Contractor's Road will require hand digging to the water table prior to drilling any locations in this area and all trenching will be performed by hand;
- Maintenance of Traffic (MOT) will be required to shut down part of Contractor's Road during installation of air sparge wells and piping beneath and adjacent to the roadway.

Air sparge well spacing in the source zone and under the building was approximately 20 feet between wells. The well spacing for the 10XNADC ring was approximately 30 feet between wells. The ROI is assumed to be 20 ft. The SVE system would be constructed with 16 of the SVE chambers described in the overview section, with five of those chambers located around the building's footprint.

Operation and maintenance of the system would be performed for the first three days of operation, weekly for the remainder of the first month of operation, and monthly thereafter.

Up to 15 performance monitoring wells would be installed, using DPT drilling, to supplement the existing monitoring well network at the site. The performance monitoring network (15 monitoring wells) would be sampled quarterly for CVOCs.

**BIOREMEDIATION - OVERVIEW**

Bioremediation via biostimulation involves the injection of an electron donor into the subsurface to promote reductive dechlorination utilizing the native microbial population. The electron donor provides a substrate for the anaerobic microorganisms to promote respiration of the chlorinated solvents. As the microorganisms consume the electron donor, they (i) create a reducing environment and (ii) provide electron donor for the dechlorinating organisms. Groundwater sampling has determined that *Dehalococcoides (Dhc)* organisms are present at concentrations of approximately $10^7$ gene copies per liter of groundwater and that the vinyl chloride reductase gene (*vcrA*) is present (approximately $10^6$ gene copies per liter of groundwater), ensuring capability to reduce CVOCs to ethene. Groundwater geochemical data, in combination with *Dhc*, *vcrA*, and ethene concentrations, provide confirmation that biological reductive dechlorination is occurring at CRHE.

The proposed electron donor for cost estimating purposes is EOS PRO (60% oil), a commercially available food grade emulsified oil substrate with Vitamin B12 supplement. The electron donor would be delivered to the subsurface via DPT injection points with 16 foot spacing center to center (assumes a ROI of approximately 8 feet). The estimated 8 ft ROI has been achieved at other NASA-KSC bioremediation injection sites, and groundwater movement over time will further support the distribution of the electron donor. It is assumed for Step 2 cost evaluation purposes that the injection will be performed by Vironex and Vironex will provide the

necessary specialized equipment (tanks, pumps, and hoses for dilution and mixing of electron donor) and the DPT rig for injection.

The estimated electron donor calculations (volume of EOS PRO required) is provided in **Table A-1**. Based on experience implementing bioremediation at other sites, the volume of emulsified oil utilized ranges from 0.1 to 1% of the pore volume within the treatment area. **Table A-1** provides the estimation of the amount of EOS PRO that would be required to fill 0.1 to 1% of the pore volume and also provides the vendor recommended dosing. The volume of electron donor chose from each treatment area was conservatively estimated to be within the range of the 0.1 to 1%.

Bioremediation is expected to meet the CAO within three to five years based on dechlorination rates from the source zone biostimulation at the Vehicle Assembly building/Mobile Launch Pad site.

***Bioremediation – Source Zone***

Bioremediation of the source zone includes treatment of the area with TCE concentrations greater than 1% solubility (11,000 µg/L) and includes the injection of approximately 1,700 gallons (33 drums; 52.5 gallons per drum) of electron donor into 29 injection points. The volume of electron donor will fill approximately 0.5% of the pore volume, which is a conservative estimate based on the possibility of DNAPL being present. It is assumed that the EOS will be diluted 1:20 prior to injection and that chase water will be required to achieve the estimated 8 ft ROI. The solution will be injected over the 20 to 50 ft BLS treatment interval.

For costing and evaluation purposes, a second injection event was budgeted for approximately 24 months following the initial event. The second injection event assumes injection of 50% of the original EOS PRO volume (17 drums), which will fill 0.25% of the pore volume with EOS PRO. The same number of injection locations (29) will be utilized during this second injection. It is assumed that the EOS will be diluted 1:20 prior to injection and that chase water will be required to achieve the estimate 8 ft ROI.

Up to 10 performance monitoring wells would be installed, using DPT drilling, to supplement the existing monitoring well network at the site. The performance monitoring network (10 monitoring wells) would be sampled quarterly for CVOCs, with five of the samples additionally analyzed for biological and geochemical parameters (*Dhc*, *vcrA*, sulfate, sulfide, and total organic carbon [TOC]).

***Bioremediation - 10xNADC Area***

Bioremediation of the 10xNADC area includes the source zone, as described above, as well as the 10xNADC ring (the area of 10XNADC outside the source area). Bioremediation of the 10xNADC area would follow a similar approach to source zone bioremediation, with the addition of the following design constraints and implementation considerations:

- Vertical injection points cannot be readily installed beneath the Heavy Equipment Office Building (K6-1996H) because it is currently in use by personnel; therefore, the following recommendations are made:
    - angle-drilled injection points (six) beneath the building to aid in amendment injection (only six points are included because assuming will only drill from east side of building to avoid angle drilling through utility corridor and DPT rig has limited capability to reach under building);
    - emulsified oil dosing under the building would be based on the pore volume present under the building and that volume would be injected into the six injection locations;
    - use of existing (from GSA Seized Property IM) solar-powered recirculation system (two solar panels and two pumps) to aid in amendment distribution under the building; and
    - passive vents along the building's exterior walls to avoid potential accumulation of methane beneath the occupied building.
- Utilities in the corridor east of Contractor's Road will require hand digging to the water table prior to drilling any locations in this area;
- MOT will be required to shut down part of Contractor's Road during injection work in and adjacent to the roadway.

The bioremediation of the source zone would be implemented as described in the previous section. Within the 10xNADC ring, bioremediation would include the injection of approximately 3,600 gallons (69 drums) of EOS PRO into 84 injection points. The solution will be injected over the 20 to 50 ft BLS treatment interval. The volume of EOS PRO will fill 0.2% of the 10xNADC ring pore volume. The percentage of the pore volume to be filled in the 10xNADC ring was reduced from the dosing used in the source zone, since the concentrations in this area are less than what are observed in the source zone. A total of 102 drums would be injected into 113 injection points in both the source zone and 10xNADC ring. For the six angled injections beneath the building, drilling will be performed east of the building to avoid drilling in the utility corridor.

For budgeting purposes, a second injection event is proposed may be performed 24 months following the initial event. The second injection event would involve the injection of 50% of the original EOS PRO volume (17 drums) to the same number of injection points in the source zone, and injection of 50% of the original EOS PRO amount into 50% of the original injection points in the 10xNADC ring (18 drums). A total of 35 drums of EOS PRO would be injected during the second event.

The solar-powered recirculation system will aid in distribution of amendment beneath the Heavy Equipment Office Building. Two 5-inch diameter extraction wells: one screened from 20 to 35 and one screened 35 to 50 ft BLS and two clusters with two 4-inch injection wells (a total of four wells) with the same screen intervals would be installed via hollow stem auger drilling. Solar-powered pumps would be installed within the extraction wells and piping would be installed in a trench exterior to and running along the southern portion of the building. Four passive vents would be installed, two on the east and two on the west side of the building, to avoid methane accumulation beneath the occupied building.

Up to 15 performance monitoring wells would be installed, using DPT drilling, to supplement the existing monitoring well network at the site. The performance monitoring network (15 monitoring wells) would be sampled quarterly for CVOCs, with eight of the samples additionally analyzed for biological and geochemical parameters (*Dhc*, *vcrA*, sulfate, sulfide, and TOC). Also, plan to sample the injection and extraction wells semi-annually with analysis of samples for VOCs to aid in evaluation of mass removal from under the building.

**EZVI INJECTION - OVERVIEW**

Emulsified zero-valent iron promotes reductive dechlorination in a similar fashion to standard (non-emulsified) ZVI, but has the added benefit of sequestration of contaminants in the oil phase resulting in additional contaminant reduction. Additionally, the emulsified oil helps promote a more suitable environment for biological reductive dechlorination via enhanced bioremediation. EZVI is composed of micro- or nano-scale ZVI suspended in a water phase, which is encompassed by a larger oil phase and surfactant. When introduced into groundwater, an emulsion is formed which is stabilized by the surfactant. Hydrophobic contaminants such as TCE are attracted to the oil phase and are subsequently dechlorinated by the ZVI in the emulsion. EZVI is well suited to treat DNAPL source zones, but is also effective at dechlorinating dissolved-phase groundwater plumes (though the cost for EZVI typically results in the technology focused in the source zone).

The EZVI solution utilized at the CRHE area would be 5% EZVI (sizes ranging from 0.1 to 5 microns) by weight. The EZVI would be delivered to the subsurface via high pressure DPT injection into injection points with 6 foot spacing center to center (assumes a ROI of 3 feet). The target injection volume would fill 10% of the aquifer pore space within the source zone. For costing purposes, it was assumed the injection would be performed by Vironex and Vironex will provide the necessary equipment (tanks, pumps, and hoses for dilution and mixing of electron donor) and the DPT rig for injection. Vironex estimates that six injection points can be completed per day. Dosing calculations for the EZVI are included in **Table A-2**.

EZVI injection is estimated to reach the CAO within 3 to 5 years based on the results observed at Hangar K.

***EZVI Injection – Source Zone***

Approximately 20,500 gallons of EZVI solution would be injected into 126 injection points in the source zone.

For costing purposes, a second injection event is included. The second injection event would involve the injection of the half of the volume (10,250 gallons) of EZVI solution (the same concentration solution injected into half of the original locations).

Up to 10 performance monitoring wells would be installed, using DPT drilling, to supplement the existing monitoring well network at the site. The performance monitoring network (10 monitoring wells) would be sampled quarterly for CVOCs.

***Combination EZVI Injection – Source Zone/Bioremediation – 10xNADC Ring***

The treatment of the 10xNADC zone would involve a combination of EZVI injection in the source zone and bioremediation of the 10xNADC ring. Bioremediation of the 10xNADC ring involves the following design constraints and implementation considerations:

- Vertical injection points cannot be readily installed beneath the Heavy Equipment Office Building (K6-1996H) because it is currently in use by personnel; therefore, the following recommendations are made:
    - angle-drilled injection points (six) beneath the building to aid in amendment injection (only six points are included because assuming will only drill from east side of building to avoid angle drilling through utility corridor and DPT rig has limited capability to reach under building);
    - emulsified oil dosing under the building would be based on the pore volume present under the building and that volume would be injected into the six injection locations;
    - use of existing (from GSA Seized Property IM) solar-powered recirculation system (two solar panels and two pumps) to aid in amendment distribution under the building; and
    - passive vents along the building's exterior walls to avoid accumulation of methane beneath the occupied building.
- Utilities in the corridor east of Contractor's Road will require hand digging to the water table prior to drilling any locations in this area;
- MOT will be required to shut down part of Contractor's Road during injection work in and adjacent to the roadway.

EZVI injection in the source zone would be implemented as described in the previous section. Within the 10xNADC ring, bioremediation would include the injection of approximately 3,600 gallons (69 drums) of amendment into 84 injection points (same as described in the 10XNADC bioremediation description). The solution will be injected over the 20 to 50 ft BLS treatment interval. This volume will achieve a target of filling 0.2% of the 10xNADC ring pore volume with EOS PRO. For the six angled injections beneath the building, drilling will be performed east of the building to avoid drilling in the utility corridor.

For costing purposes, a second injection event is proposed approximately 24 months following the initial event. The second injection event would involve the injection of the original EZVI volume (10,250 gallons) adjacent to the half of the original injection points in the source zone, and injection of 50% of the original EOS PRO amount into 50% of the original injection points in the 10xNADC ring (18 drums).

The solar-powered recirculation system will aid in distribution of amendment beneath the Heavy Equipment Office Building. Two 5-inch diameter extraction wells: one screened from 20 to 35 and one screened 35 to 50 ft BLS and two clusters with two 4-inch injection wells (a total of four wells) with the same screen intervals would be installed via hollow stem auger drilling. Solar-powered pumps would be installed within the extraction well screens and piping would be installed in a trench exterior to and running along the southern portion of the building. Four passive vents would be installed, two on the east and two on the west side of the building, to avoid methane accumulation beneath the occupied building.

Up to 15 performance monitoring wells would be installed, using DPT drilling, to supplement the existing monitoring well network at the site. The performance monitoring network (10 monitoring wells) would be sampled quarterly for CVOCs, with 8 of the samples additionally analyzed for biological and geochemical parameters (*Dhc*, *vcrA*, sulfate, sulfide, and TOC). Also, plan to sample the injection and extraction wells semi-annually with analysis of samples for VOCs to aid in evaluation of mass removal from under the building.

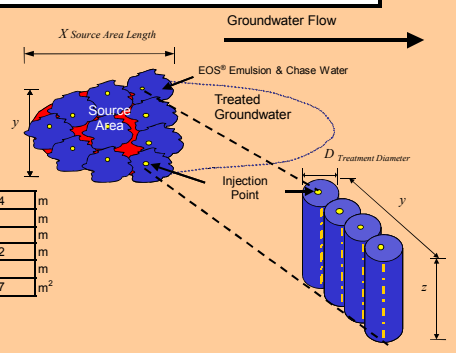
# EOS® SOURCE AREA & DNAPL DESIGN WORKSHEET

**U.S. Version 2.1g, Rev. Date: December 7, 2008**
www.EOSRemediation.com

Help

| | |
|---|---|
| Site Name: | CRHE - Source Zone |
| Location: | KSC, FL |
| Project No.: | |



## Step 1: Select a Substrate from the EOS® Family of Bioremediation Products

Substrate Selected (pick from drop down list): EOS® 598B42 (Preferred for Chlorinateds)
For Product Literature Click Here

## Step 2: EOS® Consumption During Contaminant Biodegradation / Biotransformation

### Section A: Source Area Dimensions

| | | | | |
|---|---|---|---|---|
| Length of treatment area parallel to groundwater flow, "x" | 195 | ft | 59.4 | m |
| Width of treatment area perpendicular to groundwater flow, "y" | 20 | ft | 6.1 | m |
| Minimum depth to contamination | 20 | ft | 6.1 | m |
| Maximum depth of contamination | 50 | ft | 15.2 | m |
| Treatment thickness, "z" | 30 | ft | 9.1 | m |
| Treatment zone cross-sectional area, A = y * z | 600 | $ft^2$ | 55.7 | $m^2$ |

### Section B: Groundwater Flow Rate / Site Data

Soil Characteristics

| | | | | |
|---|---|---|---|---|
| Nominal Soil Type (pick from drop down list) | Sand | | | |
| Total Porosity (accept default or enter *n*) | 0.40 | (decimal) | | |
| Effective Porosity (accept default or enter $n_e$) | 0.30 | (decimal) | | |
| Soil bulk density; (1-n)*2.65 g/cc (accept calculated or enter dry bulk density) | 1.60 | g/cc | 100 | lbs / $ft^3$ |
| Fraction of organic carbon: foc | 0.0030 | range: 0.0001 to 0.01 | | |

Hydraulic Characteristics

| | | | | |
|---|---|---|---|---|
| Hydraulic Conductivity (accept default or enter *K*) | 7.6 | ft/day | 2.7E-03 | cm/sec |
| Hydraulic Gradient (accept default or enter *i*) | 0.005 | ft/ft | | |

Note: Since the hydraulic gradient ($i = dh/dx$) is negative, we ask you to enter $-i$ in the EOS® Design Tool so that you can enter a positive number for convenience.

| | | | | |
|---|---|---|---|---|
| Non-reactive Transport Velocity, $V_x = -(K \times i) / n_e$ | 0.13 | ft/day | 0.039 | m/day |
| Groundwater flow rate through treatment zone, $Q = -KiA$ | 170.54 | gallons/day | 645.62 | L/day |

### Section C: Calculated Contact Length

| | | | | |
|---|---|---|---|---|
| Contact time ($\tau$) between oil and contaminants (accept default or enter $\tau$) | 60 | typical values 60 to 180 days, see comment | | |
| Calculated Contact Length ($x$) $= \tau * V_x$ | 7.6 | ft | 2.3 | m |

| | | | | |
|---|---|---|---|---|
| Treatment zone volume | 117,000 | $ft^3$ | 3,313 | $m^3$ |
| Treatment zone groundwater volume (volume * porosity) | 345,688 | gallons | 1,308,663 | L |

| | | | |
|---|---|---|---|
| **Section D: Design Lifespan For One Application** | 3 | year(s) | typical values 5 to 10 years |
| Estimated total groundwater volume treated over design life | 532,434 | gallons | 2,015,621 L |

### Section E: Electron Acceptors

***Dissolved Phase Electron Donor Demand***

| Inputs | Typical Value | GW Conc. (mg/L) | MW (g/mole) | e⁻ equiv./ mole | Stoichiometry *Contaminant/* $H_2$ *(wt/wt* $H_2$*)* | Hydrogen Demand *(g* $H_2$*)* |
|---|---|---|---|---|---|---|
| Dissolved Oxygen (DO) | 0 to 8 | 0.5 | 32.0 | 4 | 7.94 | 126.9763158 |
| Nitrate Nitrogen ($NO_3^-$ - N) | 1 to 10 | 1 | 62.0 | 5 | 12.30 | 163.8213163 |
| Sulfate ($SO_4^{2-}$) | 10 to 500 | 500 | 96.1 | 8 | 11.91 | 84596.94462 |
| Tetrachloroethene (PCE), $C_2Cl_4$ | | | 165.8 | 8 | 20.57 | |
| Trichloroethene (TCE), $C_2HCl_3$ | | 46.75 | 131.4 | 6 | 21.73 | 4337.111698 |
| cis-1,2-dichloroethene (c-DCE), $C_2H_2Cl_2$ | | 26.443 | 96.9 | 4 | 24.05 | 2216.547769 |
| Vinyl Chloride (VC), $C_2H_3Cl$ | | 3.672 | 62.5 | 2 | 31.00 | 238.7196134 |
| Carbon tetrachloride, $CCl_4$ | | | 153.8 | 8 | 19.08 | |
| Chloroform, $CHCl_3$ | | | 119.4 | 6 | 19.74 | |
| *sym*-tetrachloroethane, $C_2H_2Cl_4$ | | | 167.8 | 8 | 20.82 | |
| 1,1,1-Trichloroethane (TCA), $CH_3CCl_3$ | | | 133.4 | 6 | 22.06 | |
| 1,1-Dichloroethane (DCA), $CH_2CHCl_2$ | | | 99.0 | 4 | 24.55 | |
| Chloroethane, $C_2H_5Cl$ | | | 64.9 | 2 | 32.18 | |
| Perchlorate, $ClO_4^-$ | | | 99.4 | 8 | 12.33 | |
| Hexavalent Chromium, Cr[VI] | | | 52.0 | 3 | 17.20 | |
| User added | | | | | | |
| User added | | | | | | |
| User added | | | | | | |

***Sorbed Phase Electron Donor Demand***

The concentration of the sorbed contaminant can be estimated by: $C_{SOIL} = K_{OC} \times f_{oc} \times C_{WATER}$

Where: $K_{oc}$ is partition coefficient with respect to organic carbon.
$f_{oc}$ (fraction organic carbon) is the mass of organic matter in soil divided by the total mass of soil
$C_{WATER}$ is the concentration of the contaminant in the groundwater

Default values for Koc taken from: US EPA, Superfund Section, APPENDIX K, Soil Organic Carbon (Koc) / Water (Kow) Partition Coefficients (Average Value Used)

| Inputs<br>Adjust *Koc* as necessary to provide site specific estimates or enter sediment concentration ($C_{SOIL}$) | $K_{oc}$ (L/kg) | $C_{SOIL}$ (mg/Kg) | Mass (g) | Hydrogen Demand *(g* $H_2$*)* |
|---|---|---|---|---|
| Tetrachloroethene (PCE), $C_2Cl_4$ | 272 | | | |
| Trichloroethene (TCE), $C_2HCl_3$ | 165.7 | | | |
| cis-1,2-dichloroethene (c-DCE), $C_2H_2Cl_2$ | 45.6 | | | |
| Vinyl Chloride (VC), $C_2H_3Cl$ | 26.3 | | | |
| Carbon tetrachloride, $CCl_4$ | 158 | | | |
| Chloroform, $CHCl_3$ | 53 | | | |
| *sym*-tetrachloroethane, $C_2H_2Cl_4$ | 79 | | | |
| 1,1,1-Trichloroethane (TCA), $CH_3CCl_3$ | 139 | | | |
| 1,1-Dichloroethane (DCA), $CH_2CHCl_2$ | 54 | | | |

| User added | | | | |
| User added | | | | |

### Section F: Additional Hydrogen Demand and Carbon Losses

| Generation (Potential Amount Formed) | Typical Value | GW Conc. (mg/L) | MW (g/mole) | e⁻ equiv./ mole | Stoichiometry *Contaminant / $H_2$* | Hydrogen Demand *(g* $H_2$*)* | DOC Released *(moles)* |
|---|---|---|---|---|---|---|---|
| Estimated Amount of $Fe2^+$ Formed | 10 to 100 | 50 | 55.8 | 1 | 55.41 | 1818.913839 | |
| Estimated Amount of Manganese ($Mn^{2+}$) Formed | | | 54.9 | 2 | 27.25 | | |
| Estimated Amount of $CH_4$ Formed | 5 to 20 | 10 | 16.0 | 8 | 1.99 | 10130.75121 | |
| Target Amount of DOC to Release | 60 to 100 | 100 | 12.0 | | | | 16781.46 |

**Design Safety Factor:** 2.0 typical values 1 to 3

**Calculations assume:**
1.) all reactions go to completion during passage through emulsified edible oil treated zone; and,
2.) perfect reaction stoichiometry.

### EOS® Requirement Calculations Based on Hydrogen Demand and Carbon Losses

| | | |
|---|---|---|
| Stoichiometric Hydrogen Demand | 456.5 | pounds |
| DOC Released | 1,916.2 | pounds |

**EOS® Requirement Based on Hydrogen Demand and Carbon Loss**
3,997 lbs

## Step 3: EOS® Requirement Based on Attachment by Aquifer Material

**Soil Characteristics**

| | | |
|---|---|---|
| Effective treatment thickness, "$z_e$" (typically less than 40%) | 0.40 | |
| For Additional Information on Effective Thickness, Click Here | | |
| Weight of sediment to be treated | 4,684,101 | lbs |
| Adsorptive Capacity of Soil (accept default or enter site specific value) | 0.0010 | lbs EOS® / lbs sediment |

**EOS® Attachment by Aquifer Material[1]**
- Fine sand with some clay 0.001 to 0.002 lbs EOS® / lbs soil
- Sand with higher silt/clay content 0.002 to 0.004 lbs EOS® / lbs soil

[1]Default values provided based on laboratory studies completed by NCSU
For Additional Data, Click Here

**EOS® Requirement Based on Oil Entrapment by Aquifer Material**
4,684 lbs

## Summary – How much EOS® do you need?

**Suggested Quantity of EOS® for Your Project:** 12 drums

**Table 1. Source Zone Air Sparge/Soil Vapor Extraction Costing**
**Step Two Engineering Evaluation**
**Contractor's Road Heavy Equipment Area**

TECHNOLOGY: Air Sparging with SVE of Source Zone (TCE concentrations greater than 1% solubility)

DESCRIPTION: Installation of 13 sparge wells with a maximum depth of 50 ft BLS with 20-inch schumasoil screens. Installation of an SVE system including SVE chambers at approximately 20 foot spacing north and south of the central piping line. Installation of 10 performance monitoring wells with maximum depths of 40 ft BLS (5 monitoring wells) and 50 ft BLS (5 monitoring wells). Performance monitoring includes sampling of 10 monitoring wells for VOCs quarterly for three years. Assumes use of NASA's mobile air sparge trailer #2 (25 hp), cycling between two zones (one with six, and one with seven sparge wells).

**Step Two Engineering Evaluation**
**Contractor's Road Heavy Equipment Area**

TECHNOLOGY: Air Sparging with SVE of 10xNADC Plume (concentrations of TCE, cDCE, and VC greater than 10xNADC)

DESCRIPTION: Installation of 34 sparge wells to a maximum depth of 50 ft BLS with 20-inch schumasoil screens. Installation of an SVE system including SVE chambers at approximately 20 foot spacing north and south of the central piping line in the source zone and around the building. Installation of 15 performance monitoring wells with maximum depth of 40 ft BLS (7 monitoring wells) and 50 ft BLS (8 monitoring wells). Performance monitoring includes sampling of 15 monitoring wells for VOCs quarterly for three years. Assumes use of NASA's mobile air sparge trailer #2 (25 hp), cycling among three zones, two with 11 and one with 12 sparge wells).

**Table 3. Source Zone Bioremediation Costing**
**Step Two Engineering Evaluation**
**Contractor's Road Heavy Equipment Area**

TECHNOLOGY: Bioremediation of Source Zone (TCE concentrations greater than 1% solubility)

DESCRIPTION: DPT injection of emulsified oil (33 drums) at 29 injection points from 20 to 50 ft BLS. Injection of emulsified oil will occur in one injection event, with a second event included 24 months after the first, using 50% of the volume of EOS (17 drums) injected during the initial event. Installation of 10 performance monitoring wells with maximum depth of 40 ft BLS (5 monitoring wells) and 50 ft BLS (5 monitoring wells). Performance monitoring includes sampling of 10 monitoring wells for VOCs (including additional biological and geochemical analyses from 5 wells) quarterly for five years.

TECHNOLOGY: Bioremediation of 10xNADC Plume (concentrations of TCE, cDCE, and VC greater than 10xNADC)

DESCRIPTION: DPT injection of EOS (102 drums) at 113 injection points from 20 to 50 ft BLS. A recirculation system with two injection well clusters and one extraction well cluster (screened from 20 to 35 and 35 to 50 ft BLS). Injection of EOS will occur in one injection event, with a second event included 24 months after the first, using 50% of the EOS volume in all original locations in the source zone (17 drums) and 50% of the EOS volume in 50% of the original locations in the 10xNADC ring (18 drums). Installation of 15 performance monitoring wells with maximum depth of 40 ft BLS (7 monitoring wells) and 50 ft BLS (8 monitoring wells). Performance monitoring includes sampling of 15 monitoring wells for VOCs (including additional biological and geochemical analyses from 8 wells) quarterly for five years.

**Table 5. Source Zone EZVI Injection Costing**
**Step Two Engineering Evaluation**
**Contractor's Road Heavy Equipment Area**

TECHNOLOGY: EZVI Injection within Source Zone (TCE concentrations greater than 1% solubility)

DESCRIPTION: Injection of approximately 20,500 gallons of EZVI using direct-push drilling injection methods at 126 locations from 20 to 50 ft BLS. Injection of EZVI will occur in an initial injection event, followed by a second event 24 months later. Installation of 10 performance monitoring wells with maximum depth of 40 ft BLS (5 monitoring wells) and 50 ft BLS (5 monitoring wells). Performance monitoring includes sampling of 10 monitoring wells for VOCs quarterly for five years.

**Table 6. 10xNADC EZVI Injection Costing**
**Step Two Engineering Evaluation**
**Contractor's Road Heavy Equipment Area**

TECHNOLOGY: EZVI Injection within Source Zone (TCE concentrations greater than 1% solubility) and Bioremediation of 10xNADC ring (area with concentrations of TCE, cDCE, and VC greater than 10xNADC, excluding the source zone area)

DESCRIPTION: Injection of EZVI (approximately 20,500 gallons; 126 locations) in the source zone and EOS (approximately 69 drums; 84 locations) in the 10xNADC ring using direct-push methods from 20 to 50 ft BLS. Injection of EZVI and EOS will occur in two injection events, with a second event included 24 months after the initial event. The second event will use the same injection scheme in the source zone and 50% of the original EOS volume into 50% of the initial locations in the 10xNADC ring. Installation of 15 performance monitoring wells with maximum depth of 40 ft BLS (7 monitoring wells) and 50 ft BLS (8 monitoring wells). Performance monitoring includes sampling of 15 monitoring wells for VOCS (including additional biological and geochemical analyses from 3 wells) quarterly for five years.

| 1B | 10xNADC AS/SVE | $424,600 | $121,200 | $153,600 | N/A | N/A | N/A | 2 | $700,000 | $690,000 | 152 | $4,600 |
| | | $424,600 | $121,200 | $153,600 | $121,200 | N/A | N/A | 3 | $820,000 | $800,000 | | $5,400 |
| 2B | 10xNADC Bioremediation | $440,500 | $99,500 | $290,100 | $99,500 | N/A | N/A | 3 | $930,000 | $910,000 | 152 | $6,100 |
| | | $440,500 | $99,500 | $290,100 | $99,500 | $99,500 | $99,500 | 5 | $1,130,000 | $1,100,000 | | $7,400 |
| 3B | SZ EZVI 10xNADC Bioremediation | $1,009,700 | $82,500 | $543,300 | $82,500 | N/A | N/A | 3 | $1,720,000 | $1,680,000 | 152 | $11,300 |
| | | $1,009,700 | $82,500 | $543,300 | $82,500 | $82,500 | $82,500 | 5 | $1,880,000 | $1,840,000 | | $12,400 |

**Notes:**

1. Alternatives 2A, 3A, 2B, and 3B assume a second injection event performed 24 months after the initial event.
2. Bioremediation indicates biostimulation with emulsified oil.
3. Alternatives 2B and 3B include recirculation beneath the building and passive venting around the building.
4. SZ indicates source zone.
5. NADC indicates natural attenuation default concentration.
6. AS/SVE indicates air sparging and soil vapor extraction.
7. EZVI indicates emulsified zero valent iron.
8. "Pay as You Go" costs do not consider inflation during the remediation period.
9. Net rate of return: 5%
10. All alternatives include DPT sampling costs in Year 2.

# MEMORANDUM

| | |
|---|---|
| Date: | 6 February 2014 |
| To: | Anne Chrest |
| Copies to: | NASA Remediation Team |
| From: | Tom Peel, Ph.D., Rebecca Daprato, Ph.D., P.E., and Jill Johnson, P.G. |
| Subject: | Contractor's Road Heavy Equipment Area Hot Spot 1 Step 2 Engineering Evaluation – Response to Comments |

---

Comments on the Step 2 Engineering Evaluation were received and are addressed below. The comment is listed first and Geosyntec's response is listed in italics below the comment.

**Jacobs Comments:**

The ADP provided a good synopsis of known site conditions and is well-illustrated. The conceptualization of a continuous source zone is a very good approach. We offer the following comments for your consideration:

**Step 2 ADP**

1. Slide 24 (new slide 27) – For the CAO, please clarify what is meant by "concentrations which will support Long Term Monitoring." Since the CAO applies to a hot spot and source zone, it seems an HCP action would be a potential follow-on step as overall site cleanup progresses.

*Response: With the existing CAO, NASA, the KSC Remediation Team, and the A&E have the flexibility to evaluate performance and base a recommendation for follow-up action (if necessary) on the performance. If the CAO is to progress the site to an HCP action, it does not provide the same level of flexibility and decision making based on implementation results.*

2. Alternative 1A, SZ Air Sparge and SVE: General – The site conceptual model includes probable DNAPL in the SZ. There is little literature regarding reduction of DNAPL by air sparging, so citations of applicable studies would be helpful in evaluating the estimate for the time to achieve the CAO and in evaluating the likelihood of rebound. We recognize that

good information about air sparging performance in DNAPL source zones will be generated by the CCB Hot Spots 1 and 2 IM in the near future.

*Response:* *Based on the size of the source zone (0.04 acres – the non-inferred area), the likelihood of "pools" of DNAPL mass is relatively small. It is anticipated that the DNAPL mass present is likely smaller ganglia, which are easier to treat via AS. It has been documented that AS is a viable technology for sites that have low levels of DNAPL and LNAPL (not recoverable) as noted in the references below.*

- *Air Sparging Guidance Document (TR-2193-ENV) Naval Facilities Engineering Service Center, August 2001;*
- *Dense Nonaqueous Phase Liquids (DNAPL) Treatment Technologies (http://cluin.org/contaminantfocus/default.focus/sec/Dense_Nonaqueous_Phase_Liquids_%28DNAPLs%29/cat/Treatment_Technologies/) – developed by the EPA Ground Water Task Force.*
- *While not a specific literature reference, Geosyntec designed, installed, and operated an AS/SVE system at Lipham Cleaners in Longwood, Florida, which had PCE groundwater concentrations exceeding 10% of solubility (0.32 acres) and plume depth similar to CRHE (depth of sparge wells ~36 ft BLS). The AS operations at the site reduced groundwater concentrations to less than NADCs in 2.5 years.*

3. Alternative 1A, SZ Air Sparge and SVE: General – Where there is DNAPL, the free phase product (TCE in this case) typically occupies a significant portion of available pore space. Air will seek the path of least resistance, so it seems likely that air-to-DNAPL contact will be low. What is the expected mechanism for reduction of DNAPL mass by air sparging? Please include your assumptions about degradation rate and effectiveness. It is important to understand these in order to evaluate and confirm estimates of time to achieve NADCs and cost.

*Response:* *DNAPL mass reduction via AS can occur via two mechanisms: (i) the volatilization of the DNAPL via direct contact with the air; and (ii) the dissolution of DNAPL into the groundwater as the dissolved concentrations are removed via volatilization. The rate for direct volatilization of the DNAPL would be comparable to rates observed at other sites where AS has been implemented. The rate for dissolution of DNAPL into the groundwater would be slower. The time to achieve the CAO was estimated to be the time to reduce CVOCs to NADCs and was based on air sparging results at other sites (one to two years) with time added for the dissolution of the DNAPL into groundwater.*

*It should be noted that the conceptual layout also included a very robust air sparge well network in the area of potential DNAPL to create an aggressive environment (20 foot spacing of AS wells). Operation of the system in this environment would include an aggressive dynamic approach to maximize air-to-DNAPL contact.*

4. Alternative 1B, 10X NADC Plume Air Sparge and SVE: Slide 35 – The conceptual plan calls for angular drilling to deploy AS wells under the building, with SVE wells positioned along the perimeter. Please confirm the influence of the perimeter SVE network is adequate to capture vapors from beneath the building.

*Response: The estimated ROI of the SVE system is between 20 ft and 30 ft (as described in the Description of Alternatives). The layout of the SVE wells with the estimated ROI should be adequate to cover the area underneath the building (approximate size of 70 by 50 ft) – see updated figure in the ADP with estimated ROI presented on slide 50. The layout is more than adequate for a conceptual design and associated costing and the exact details of the SVE layout will be evaluated during the design phase, if AS/SVE is selected.*

5. Alternative 1B, 10X NADC Plume Air Sparge and SVE: Slide 40 (new slide 54) – The plastic cap described in the Alternatives Description is not included in the SVE chamber detail. We suggest it be added.

*Response: A note was added to the ADP to provide information about the plastic cap on the SVE chamber detail. The specific engineering details of the plastic cap (which may not be warranted at all locations) is a design detail which would be included in the Interim Measure design, if AS/SVE is selected.*

6. Alternative 2A, SZ Bioremediation: General – Emulsified oil is well-documented as a successful technology for enhanced reductive dechlorination of hot spots and areas affected by flux from DNAPL, particularly in aerobic environments, but literature regarding reduction of DNAPL mass is sparse. Citations of applicable studies would be helpful. We note the reference to the MLP/VAB Area and the successful treatment there, but also note that the highest TCE detection at that site was an order of magnitude below the highest detections at CRHE.

*Response: Bioremediation has been utilized at a number of DNAPL sites, including successful applications at three NASA sites where DNAPL has been present: LC34 (Demonstration of Biodegradation of DNAPL - 2004), LC34 Partitioning Electron Donor*

*IM Hot Spot 1, and MLP (biostimulation using ethyl lactate). It should also be noted that at facilities where EZVI has been applied (LC34, Hangar K and Paris Island) collected data and documents indicate that the mass reduction is due to both abiotic and biotic reductive dechlorination.*

*With regards to TCE concentrations at MLP, TCE was measured at a maximum concentration of 95,000 µg/L from DPT location MLP-PT6 in 2002 and a maximum soil concentration of 102 mg/kg of TCE was detected (MLP-RTS1). The referenced concentrations are indicators of the presence of DNAPL. Concentrations of all CVOCs were reduced to below NADCs (TCE and cDCE to below GCTL) and VC is the only COC that remains above the GCTL.*

*The LC34 PED IM was implemented in an area with a maximum TCE concentration of 141,000 µg/L, an average TCE concentration of 22,000 µg/L, and a maximum soil concentration of 56.2 mg/kg TCE.*

*The LC34 (Demonstration of Biodegradation of DNAPL) initial TCE concentration of 132,000 µg/L to 350,000 µg/L and complete dechlorination to ethene was observed, with a TCE mass removal of 98.5%. Complete dechlorination occurred with up to 92 mg/L ethene production observed.*

*Based on the above data, the use of MLP dechlorination rates is adequate to estimate a time to reach CAO for CRHE.*

*Additionally, there is an Interstate Technology and Regulatory Council guidance document that consider the bioremediation of DNAPL source zones viable and provide case studies: In Situ Bioremediation of Chlorinated Ethene: DNAPL Source Zones (BIODNAPL) – June 2008.*

7. Alternative 2A, SZ Bioremediation: General/Alternatives Description – Since contact with DNAPL is critical, please consider adding a discussion of the delivery mechanism for the emulsified oil. While the chase water will be beneficial in overall dispersion, it may be unlikely to enhance contact within DNAPL zones.

*Response: Direct contact of the oil with the DNAPL is not required for bioremediation to be successful. Mass removal of DNAPL during bioremediation is due to the microorganisms dechlorinating the CVOC mass (reducing concentrations) in the dissolved phase, which creates a concentration gradient and then dissolution of the DNAPL occurs. The emulsified*

*oil will be delivered via DPT injection (6 to 8 gpm and 30 to 45 psi) and the chase water will be used to create the desired radius of influence from each injection point.*

8. Alternative 2A, SZ Bioremediation: Slide 43 (new slide 59) – Was a case study or information from one of your other sites used to develop the conceptual design of a 0.5% initial/0.25% follow-up pore volume emulsified oil application?

*Response: The emulsified oil dosing that we have used successfully during bioremediation implementation is between the range of 0.1% to 1% of the pore space and usually for dissolved phase plumes is around 0.1 to 0.2% of the pore space. The dosing of 0.5% and 0.25% was selected within that range and above the vendor's recommendation to be conservative.*

9. Alternative 2A, SZ Bioremediation: Slide 43 (new slide 59)/Alternatives Description – We assume multiple lifts will be used to deliver emulsified oil through the treatment zone. What is the anticipated vertical area of influence for each lift?

*Response: Multiple lifts would occur to deliver the emulsified oil, continuously over the entire treatment interval. The anticipated vertical lift would be every 2 feet and emulsified oil and chase water would be injected to reach the desired ROI. The injection details will be decided during the design, if bioremediation is selected.*

10. Alternative 2A, SZ Bioremediation: Slide 46 (new slide 66) – Since the estimate of time to achieve CAO was based on MLP dechlorination rates, was a factor applied to account for the variance in TCE concentrations between the two sites?

*Response: A factor was not applied to account for the variance in concentrations between the two sites, since the TCE concentrations are similar – see response to Jacob's comment #6. TCE is generally not the rate limiting CVOC with regards to dechlorination (longest time to NADC); it is usually vinyl chloride. The time to reach CAO was based on the dechlorination rates for vinyl chloride from MLP. Using MLP rates, time to reach NADC for TCE was approximately 2 years, for cDCE was approximately 3.4 years and for vinyl chloride approximately 4.4 years; therefore, a range of 3 to 5 years was selected for this evaluation.*

11. Alternative 3A, SZ EZVI: Slide 54 (new slide 78) /Alternatives Description – What injection technique did Vironex use for development of the conceptual design? Will that technique be able to access the DNAPL pore space? Note that at Hangar K, a 6-ft. ROI was

achieved using the Badger© technology. (A 6-ft ROI was also assumed in the recent injections at the GSA Reclamation Yard, but we won't have confirmation of the ROI until the first performance monitoring event.) We are concerned both that the 3-ft. ROI assumed may be overly conservative, but – at the same time – injection cost may be understated since the injection technique is not described.

*Response: Vironex uses a high-performance double piston pump to inject EZVI, top down, at approximately 50 gpm to achieve lateral distribution of EZVI. The high frequency piston action of the pump helps to distribute the EZVI throughout the pore space to achieve contact with the DNAPL. Each injection interval is separated by 2 ft to help minimize creation of vertical flow paths.*

*The estimated 3 ft ROI was conservative, so we have also provided a less conservative costing based on an estimated 6-ft ROI. It should be noted that our definition of ROI involves achievement of complete distribution of injectate throughout the desired target interval (not an indicator of a seam of EZVI at 6 ft); accordingly, we used a more conservative 3 ft ROI since the ZVI component is dependent on contact to achieve the desired abiotic reductions intended to target DNAPL. This non-conservative costing resulted in a capital cost range of $673,000 to $734,000 and the second injection cost ranged from $306,000 to $336,000 (total cost reduction of $90,000). For the source zone, this would reduce the cost range from $1,240,000 to $1,340,000 to $1,149,000 to $1,249,000. For the 10X NADC area, this would reduce the cost range from $1,718,000 to $1,883,000 to $1,628,000 to $1,793,000. The cost driver for EZVI is the purchase of the material (~$700,000 for two injection events); accordingly, the less conservative 6 ft ROI does not have a significant bearing on the range of costs.*

12. Alternative 3A, SZ EZVI: Slide 57 (new slide 83) – Regarding time to achieve CAO based on results from Hangar K: At Hangar K, TCE concentrations were reduced by 88% six months after the first injection. After a pre-programmed second injection and a total elapsed time of 18 months from the first injection, TCE concentrations were reduced by 99%. It does not appear that NADC for all chlorinated VOCs will be reached within 5 years.

*Response: The concentrations at Hangar K were higher and the impacted area was larger than what is observed at CRHE; two 200 ppm TCE plumes were delineated that were approximately 3,000 and 6,200 square feet (with impacts from ~ 30 to 52 ft BLS).*

*To reduce the average CVOC concentrations to their NADCs in the SZ, a reduction in mass of 98.4% (VC), 98.5% (cDCE), and 99.6% (TCE) is required. If the removal is based on the maximum concentrations, a concentration reduction of 99.8% (TCE), 99.4% (cDCE) and 99.5% (VC) is required. Based on the site conditions, we believe a 5 year timeframe is adequate for these reductions.*

13. Alternative 3B, 10X NADC Plume EZVI and Bioremediation with Recirculation: General – EZVI was engineered specifically as a DNAPL technology. Consider reducing the footprint of the EZVI application in the inferred SZ. When using EZVI in combination with technologies that enhance biological degradation, please consider applying EZVI only in the zones where the TCE concentrations exceed 10% of solubility. At Hangar K, EZVI was applied in zones where TCE concentrations were ≥200 ppm.

*Response: There are only two locations at CRHE with TCE concentrations near 10% TCE solubility (110,000 µg/L): DPT0072 from 36 to 40 ft BLS (160,000 µg/L) and DPT0134 from 36 to 40 ft BLS (100,000 µg/L); therefore, adjusting the treatment area to encompass the 10% solubility would create a small treatment area. The footprint for EZVI injection was agreed upon in the Step 1 to evaluate the implementation in the area where TCE is greater than 1% solubility. A reduction of the vertical treatment interval, currently from 20 to 50 ft BLS, can be evaluated during the design phase, by utilizing the DPT sampling data to reduce the vertical treatment interval.*

14. Alternative 3B, 10X NADC Plume EZVI and Bioremediation with Recirculation: Slide 63 (new slide 90) – Similar to the note regarding Slide 57: At Hangar K, the HCP was treated using emulsified vegetable oil and lactate. Early indications are that the dissolved plume's decay has accelerated through the combination of SZ and HCP treatment, but it does not appear that NADC for all chlorinated VOCs will be reached within 5 years.

*Response: The calculation of time to reach NADC for each CVOC using enhanced bioremediation was based on MLP dechlorination rates and we feel this is an appropriate approximation.*

15. Technology Comparison and Technology Cost Comparisons – For SZ Alternatives 1A (air sparging) and 2A (emulsified oil), we are concerned that the lack of documented performance history for these technologies for DNAPL treatment may result in some understatement of both the estimated time to achieve CAO and the treatment cost. Treatment success at CRHE will largely depend on the amount of DNAPL present and how

efficiently that DNAPL mass is removed or controlled. Inclusion of applicable site or study information would be very helpful.

*Response: See responses to comment #2 and #6 above.*

**TetraTech Comments:**

Tetra Tech generally concurs with the information presented in the Contractor's Road Heavy Equipment (CRHE) Area Step 2 Engineering Evaluation (EE) – Hot Spot 1 advanced data package (ADP), except where noted within the following comments:

**Step 2 ADP**

1. Slide 16/17 – The inferred source zone is not indicated on the cross section, as it is on the plan view drawings. We suggest that the source zone interpretation also be applied to the cross sections within the Step 2 EE.

*Response: The inferred source zone was added to the cross sections in the ADP (Figures 4 and 5).*

2. Slide 18/19 (new slide 20/21) – The mass values deviate significantly from what was presented in the Step 1 EE. We suggest providing information to what influenced the increase in calculated mass from the Step 1 to 2 EE, the Geosyntec presentation response to Tetra Tech's Step 1 EE comment regarding mass does not parallel what is provided in the Step 2 EE.

*Response: The mass estimates from the Step 1 ADP have been added to the ADP. For the source zone, the TCE mass estimate was modified from what was presented in the Step 1 because the area increased (see note 2 of the table – increase from 1,742 sq ft to 3,049 sq ft). The mass of TCE in the source zone from the Step 1 was approximately 26 lbs (using the hand calculated values to be conservative) and the revised mass of TCE presented in the Step 2 is 45 lbs. The cDCE and VC mass estimates were not presented for the source area in the Step 1 ADP.*

*The mass estimate presented for the 10XNADC area is the same as the mass estimate that was presented in the revised Step 1 for cDCE and VC (using the hand calculated values, which are the most conservative). The TCE mass estimate for the 10XNADC area was modified because the area of the source zone increased. In the Step 1, the mass estimates*

*were presented as "rings" and not totals for the areas, so the 10XNADC estimate did not include the source zone TCE mass.*

3. Slide 28 (new slide 33) – Due to the nature of air sparging (AS) near occupied buildings, an ambient and soil vapor extraction (SVE) air sampling program should be integrated into the conceptual design (this comment is relevant for all AS alternatives). Please include this consideration and costs into the Step 2 EE.

*Response: We agree that an ambient air sparging program should be implemented, if AS/SVE is selected and implemented. A detailed description of the sampling plan will be provided in the Step 3 and costs are minimal and are considered to be included in the O&M cost provided.*

4. Slide 30 (new slide 36) – While the horizontal layout for the AS network is very conservative, it does not appear the vertical distribution of AS points is tailored to site conditions. In the source zone area near DPT0200, we suggest installing shallower AS wells or nesting wells to address the source zone at least 20 feet above the proposed screen intervals in order to provide a more focused approach (this comment is relevant for all source zone AS alternatives).

*Response: We feel that the current vertical layout is adequate for a conceptual design and the use of nested wells would be considered as part of the design, if AS/SVE is selected.*

5. Slide 27/32/35 (new slide 31/39/46) – Is there an assumed vacuum to be applied at the horizontal SVE points that was used for SVE sizing? We also suggest including a variable frequency drive on the blower/fan in order to dial in the blower to site conditions and/or perform SVE pilot testing, if alternatives with SVE are selected. Additionally, it is not clear in the details if the chambers shown on Slide 32 contain valve boxes/vaults in order to individually control the chambers. Please clarify.

*Response: It is anticipated that the SVE system will include a blower capable of greater than 360 scfm and operate at approximately 20-inches of water to minimize the extraction of water (likely a 15 Hp Ametek Rotron Regenerative Blower). We agree that a variable frequency drive blower should be considered during the design phase. A typical detail is provided for an SVE chamber; the details about operation of the chambers will be decided during the design, if AS/SVE is selected. Geosyntec has designed SVE chambers with remote valving (typical at drycleaners where the chambers are installed beneath the*

*drycleaner slab) and with valving within vault boxes. The specifics of the valving orientation associated with the SVE chambers is a design detail.*

6. Slide 38 (new slide 51) – Based on the presented ten times Natural Attenuation Default Criteria (10X NADC) plume, it is not clear what the AS wells to the western part of the cross section are treating and this interpretation does not match what is shown in plan view. We suggest revising the cross section to provide a closer correlation to the center line of the source zone/10X NADC plume (global comment).

*Response: The 10XNADC plume on the plan view is drawn by contouring the data on the west side of the building, which the cross section does not include. The 10XNADC contour has been updated on the cross sections in the presentation.*

7. Slide 41 (new slide 56)– A pre-packaged SVE enclosure may be more appropriate and less expensive than a mobile trailer. We suggest evaluating the use of an enclosure instead of a trailer.

*Response: If AS/SVE is selected as the remedial alternative, these suggestions will be taken into consideration with NASA during the design phase.*

8. Slide 45/60/56/61 (new slide 34/74/82/88) – Do the alternatives assume treatment of the entire area that is within the blue rectangle? If this is the case, the volumes used to calculate remedial additives may be substantially overestimated for treatment of the applicable plume interval. Please clarify.

*Response: AS/SVE will treat the entire interval from 20 ft to 50 ft; therefore, to compare the same treatment volume for all three technologies, the treatment interval for both enhanced bioremediation and EZVI was expanded to 20 to 50 ft BLS.*

9. Slide 49 (new slide 72) – The passive vents, as currently placed, do not clearly appear to provide protection of methane accumulation underneath the structure. Furthermore, will the venting cause secondary issues such as odor? We recommend the methane venting approach be revised.

*Response: We feel that the passive venting system is adequate for a Step 2 evaluation. The vents provide a path for any methane produced to be discharged at the roof level to the atmosphere. During the design phase, an evaluation would be performed if active venting is recommended (could add a radon type electric or solar fan, or a wind turbine to the vent*

*stack to make the system active). It is unlikely that the passive venting will cause any secondary issues. The approach proposed has been implemented at a number of bioremediation project sites in Florida without secondary odor issues.*

10. Slide 54/59 (new slide 78/86) – The injection radius of influence (ROI) of 3 feet is very conservative and may bias the costs of emulsified zero-valent iron (EZVI) alternatives. We suggest the spacing be revisited.

*Response: The costing was updated to evaluate a non-conservative 6 ft ROI and is included in the response to Jacobs' comment #11 above.*

11. Slide 71 (new slide 104) – Prior to concurring with the selection of bioremediation, we suggest that the EZVI alternatives be revisited per Comment 10. Although there is limited case study literature available regarding the efficacy of bioremediation of dense non-aqueous-phase liquid (DNAPL), the limitations of bioremediation may be understated in this ADP. Additionally, we suggest screening bioremediation substrates that contain ZVI as a supplement to the bioremediation alternatives.

*Response: The costing was revised using a 6 ft ROI and is included in the response to Jacob's comment #11 above. See comment #6 for discussion of bioremediation in DNAPL source zones. We feel that emulsified oil is the best substrate for implementing bioremediation at this site.*

12. Cost Estimate, Global Comment – The cost estimates do not clearly identify if direct or burdened costs are presented in the Step 2 EE. Please clarify.

*Response: The cost estimates are fully burdened.*

13. Cost Estimate, T-1 – The costs presented for a SVE system are significantly higher than what would be expected, considering the size of the system. Please clarify the $50,000 line item.

*Response: The cost for the SVE system was based off of vendor provided unit pricing (from Product Recovery Management) that includes the equipment trailer, blower, moisture separator with pump-out and controls, liquid-phase carbon, telemetry, delivery and start-up assistance. The estimated cost for the system, since the components have not been specifically selected was between $40,000 and $50,000, so the conservative $50,000 cost was utilized.*

14. Cost Estimate, T-1/T-2 – The electrical line installation line item cost appears low. Please revisit.

*Response: The cost for the electric line installation was scaled from the actual cost for the electric line installation performed in 2012 at VPF. The work at VPF included the installation of 50 feet of electric line and was approximately $5,000. Therefore, we felt that the identified line item cost was a conservative estimate for this Step 2, which assumed the installation of 30 ft of electric line.*

15. Description of Alternatives, Page 5 – The stated 60% oil substrate and 1:20 dilution results in an injection concentration of approximately 3%. Considering groundwater dilution and the suspected presence of DNAPL, the substrate dosage concentrations appear low. Please provide rationale for the bioremediation dosing.

*Response: The 1:20 dilution is within the recommend range of dilution from the vendor, so that the emulsion remains stable. See response to Jacob's comment #8 above for dosing information.*

Geosyntec consultants

# Contractor's Road Heavy Equipment (CRHE) Area (SWMU055)

## Step 3 Engineering Evaluation – Hot Spot 1 IMWP

May 2014

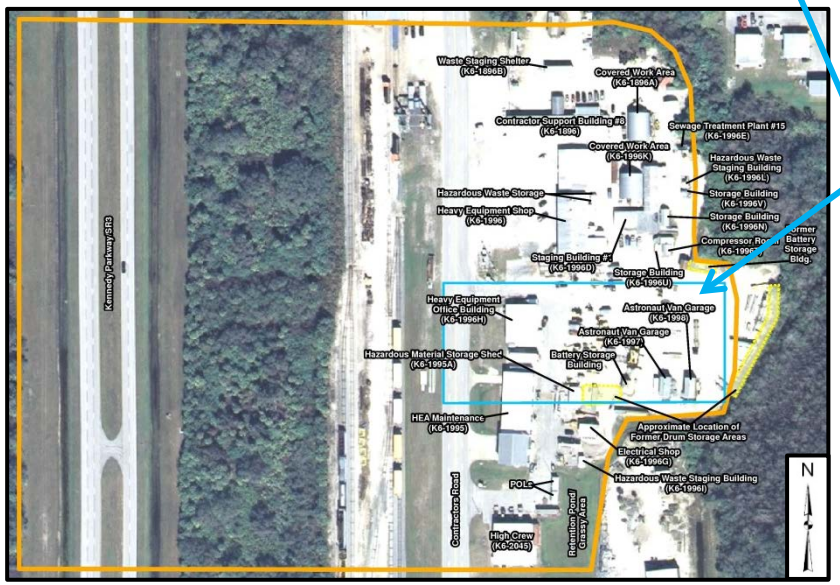
Geosyntec consultants

# Presentation Outline

- Site background
- Corrective Action Objective
- Bioremediation design details
- Performance monitoring
- Test consensus

# Site Background
## Site Overview

- HS1 features:
  - About 3 acres
  - Paved and gravel
  - Underground utility corridor east of Contractor's Road
  - Thick road base in northern part of HS1
  - Overall 10xNADC Plume runs beneath K6-1996H and Contractor's Road
  - Heavy equipment (up to 300,000 lbs) transported and stored in the area



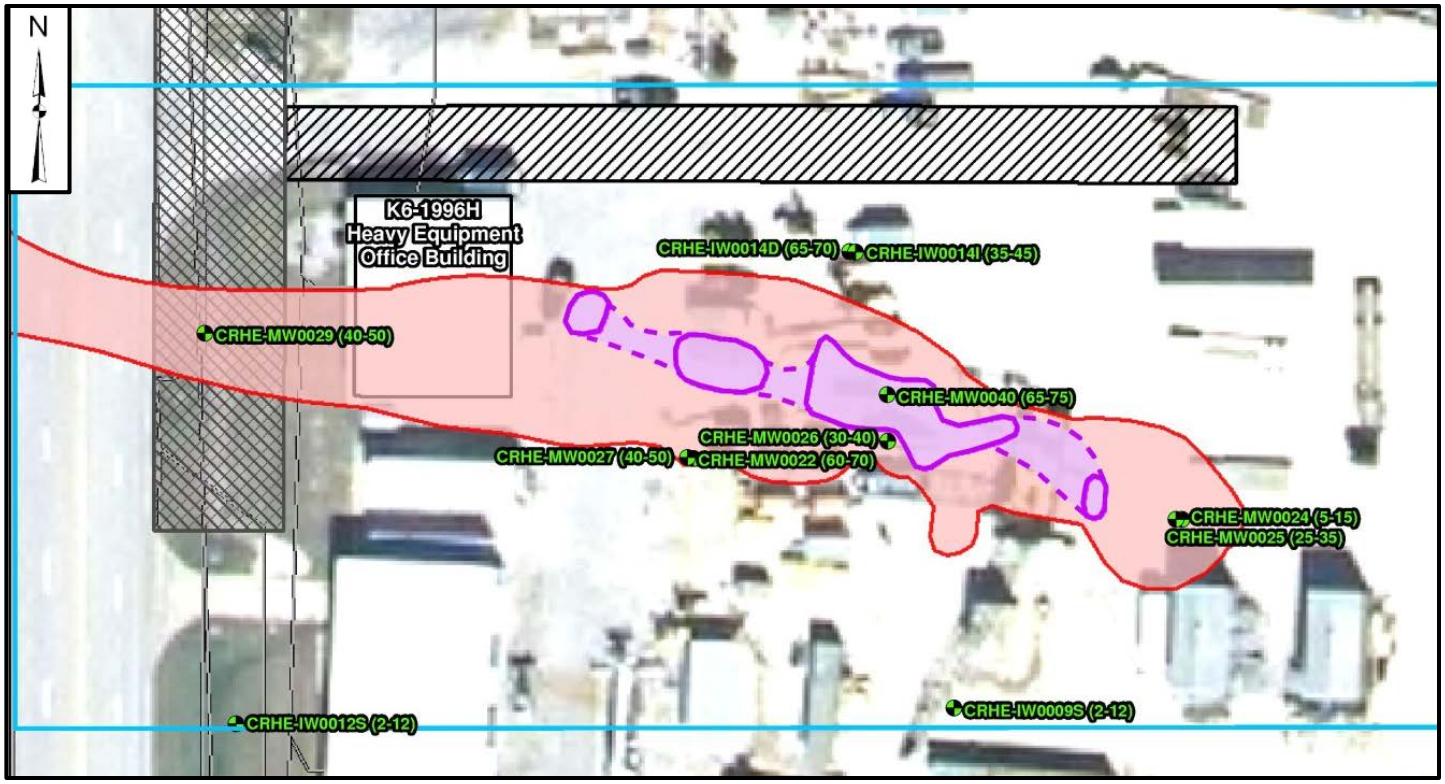
Hot Spot 1 Area

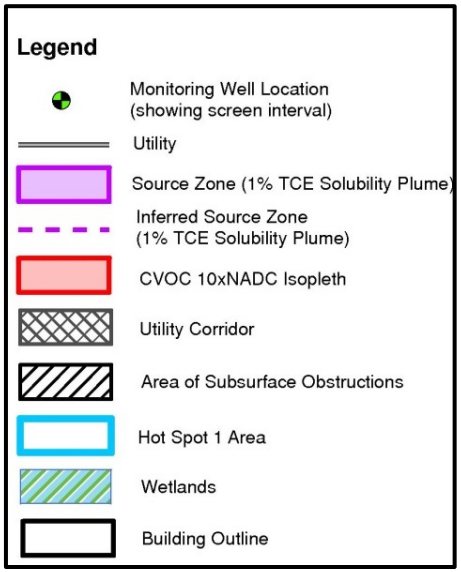
Geosyntec consultants

# Site Background

- 1997-1999: RFI (HSW, Inc.)
  - CVOC identified in groundwater above GCTLs
- 2000: Corrective Measures Study (CMS) (HSW, Inc.)
  - LTM selected remedy
- 2005 – 2009: site incorporated into VAB LTM program
- 2010: discontinued LTM until assessment is complete
- 2009 – 2013: supplemental site assessment
- 2013 December: Hot Spot 1 Step 1 EE
  - Delineation of Source Zone (TCE greater than 11,000 µg/L – 1% solubility) and CVOC 10xNADC plumes complete
  - recommended evaluation of bioremediation, emulsified zero valent iron (EZVI), and air sparge/soil vapor extraction (AS/SVE)
- 2014 February: Hot Spot 1 Step 2 EE
  - Bioremediation in SZ selected for IM

# Site Background
## Overall 10xNADC Plume and Source Zone





- 10xNADC Plume is the area with TCE, cDCE, and VC greater than 10xNADC
- Inferred Source Zone area: 0.07 acres (3,050 $ft^2$)

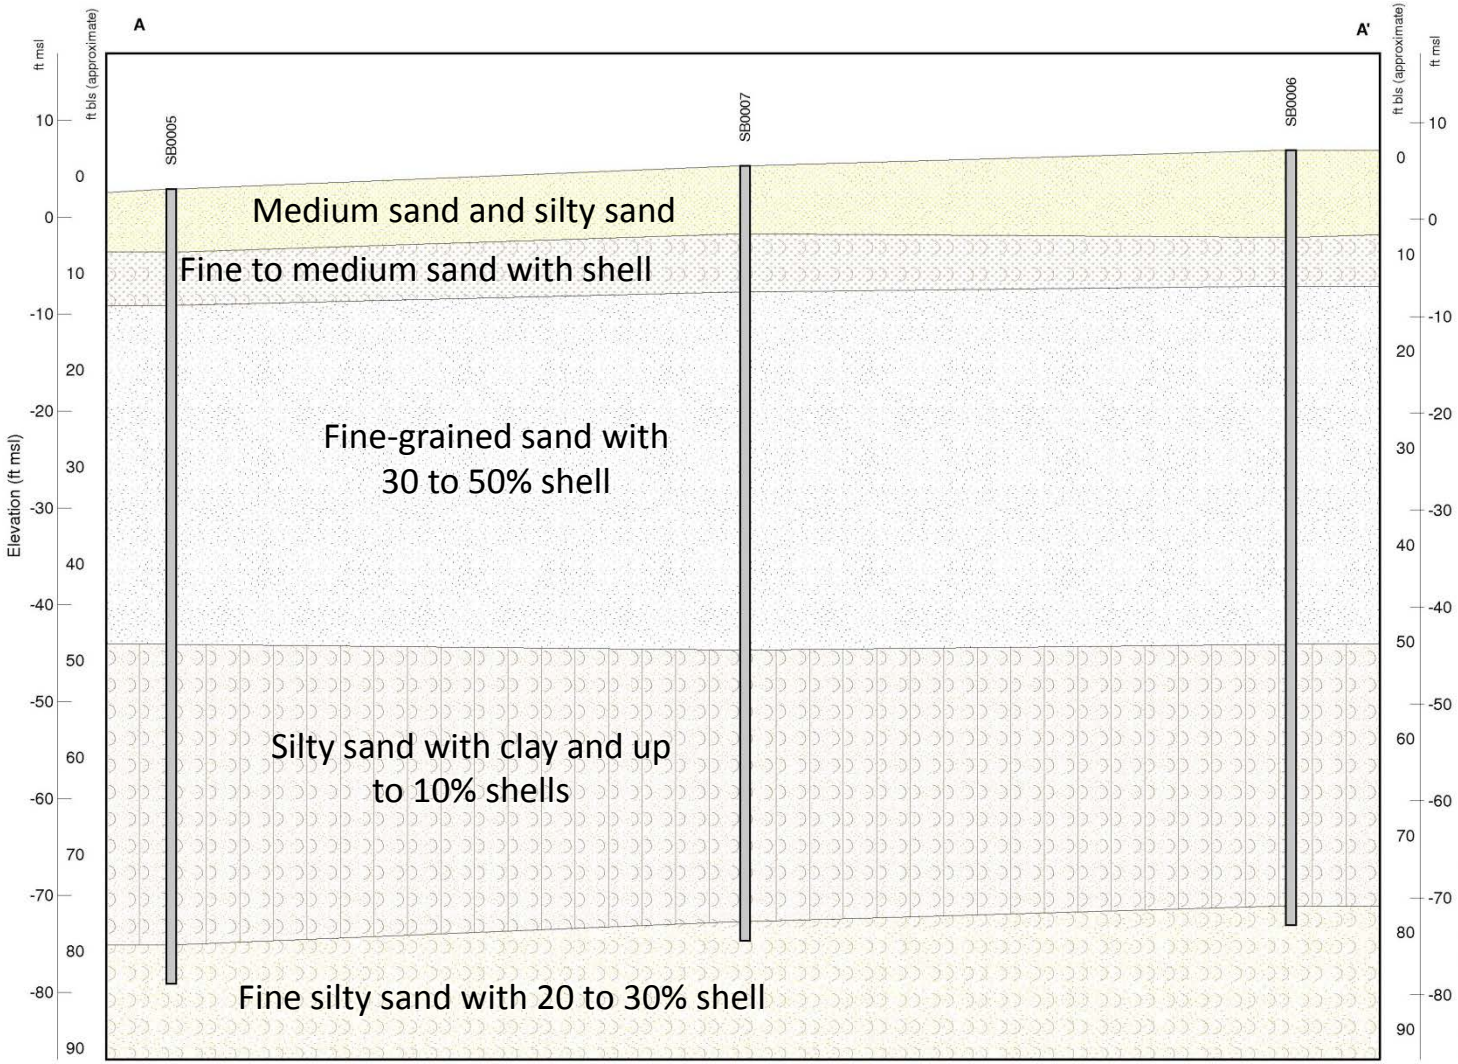
# Response to Comments

- Jacobs ADP Comment #2: Slide 5 (new slide 5) – Shows the SZ Area and 10x NADC exceedances area. Since this figure was based upon the DPT results presented in Slide 9, consider having the information on Slide 9 precede Slide 5.

- *Response: The location of this slide is to help aid in the discussion of treatment intervals and monitoring depth, the slide was not intended to be provided as background information.*

Geosyntec consultants

# Site Background Lithology



# Response to Comments

- TT IMWP Comment #2: Section 2.7 – It would be helpful in evaluating biological conditions if chloride data at the injection depth intervals is provided in this section. Overall, this section was very helpful in supporting the appropriateness of bioremediation at CRHE.

- *Response: Chloride data was not collected at this site. During the data gap sampling in December 2013, the salinity from monitoring wells MW0025 (0.77%) and MW0029 (1.5%), indicate that chloride should not affect Dhc. Additionally, ethene and ethane were detected at the site and that suggests that complete dechlorination is occurring.*

# Corrective Action Objective

- Corrective Action Objective to reduce CVOC concentrations to less than GCTLs using a treatment train approach
- IM objectives
  - to evaluate if bioremediation is effective at treating TCE concentrations that are greater than 1% of solubility (probable dense non-aqueous phase liquid)
  - to obtain data to evaluate the implementation of bioremediation in a larger treatment area

# Response to Comments

- TT IMWP Comment #1: Section 1.3 – Please verify if the objective the IM is to evaluate the effectiveness of bioremediation or to treat the plume to an endpoint (e.g., NADC, transition to MNA, etc.). As currently stated, the IM objectives appear worded towards a pilot study rather than an IM.

- *Response: The IM objective is as stated in the ADP and the IMWP and is worded this way because the IM is focused on the SZ (located within a larger plume).*

# Response to Comments

- TT ADP Comment #1: Slide 7 (new slide 9) – Please see IMWP comment regarding to IM objectives.

- *Response: See response to Tetra Tech IMWP comment #1.*

# Summary of Bioremediation

- Treatment area
  - SZ where TCE concentrations > 11,000 µg/L
  - Vertical treatment interval includes interval with CVOCs > 10xNADC (~15 to 50 ft BLS)
- Installation of eight monitoring wells
- DPT injection of 71 drums of SRS®-SD diluted 1:80 with potable water from on-site fire hydrant
- Semi-annual performance and UIC monitoring
- DPT groundwater sampling event post-injection (1 to 2 years)
  - To provide more robust understanding of CVOC concentrations
- *Dhc* and *vcrA* concentrations indicate that bioaugmentation not necessary
  - Information for optional bioaugmentation included in IMWP and UIC to prevent amendment to work plan, if site conditions change

# Response to Comments

- TT General Comment #2: Since CRHE is an active facility, it may be appropriate to provide a site layout/staging plan to provide locations where substrate, equipment, and tank staging are planned to be placed.

- *Response: We concur and believe this should be provided in the implementation work plan.*

# Response to Comments

- TT IMWP Comment #3: Section 3.1 – The inherent benefit of bioaugmenting may overweigh a "wait and see" approach. For the small capital expenditure, enhanced dechlorination may occur while biostimulation conditions are at their best and the appropriate microbial populations are present. We suggest adding the proposed KB-1 into the initial injection design to account for any uncertainty with the dechlorination potential of the indigenous populations. Alternately, microcosm testing prior to implementation of the IM may be beneficial to confirm full dechlorination and kinetics with the indigenous populations versus KB-1 bioaugmentation.

- *Response: Based upon our sampling results (presence of ethene and ethane and presence of Dhc and vcrA), we do not believe microcosm testing is necessary, since the results indicate that complete reductive dechlorination is occurring. We agree that bioaugmentation would be beneficial, but is not necessary. We propose that the decision to bioaugment be made based on the baseline sampling results. Groundwater samples will be analyzed for Dhc and vcrA from two proposed monitoring wells and if the Dhc and vcrA concentration is less than $10^6$ gene copies per liter, bioaugmentation will be performed.*

Figure 2-9

# Amendment Selection

- SRS®-SD from Terra Systems, Inc.
  - FDEP-approved substrate
  - 60% food grade soybean oil (slow release electron donor)
  - 4 to 7% potassium lactate (fast release electron donor)
  - 5 to 15% emulsifiers (proprietary) and nutrients (yeast extract, nitrogen and phosphorous to support microbial growth)
  - < 1% (minimum of 250 µg/L) vitamin B12 (important micronutrient for *Dhc*)
  - 6 to 8 grams per liter of sodium bicarbonate (to aid in buffering)
  - balance of water

# Response to Comments

- Jacobs IMWP Comment #3: Section 3 – Does SRS®-SD contain sodium bicarbonate or is the sodium bicarbonate an addition in the field? The SRS®-SD product information provided in Appendix C does not list sodium bicarbonate as an ingredient. If it is a field addition, and given the large amounts of water contemplated, is sodium bicarbonate addition at 6-8 g/L as a buffer necessary? We assume that the make-up and chase water will have a near neutral pH.

- *Response: SRS®-SD does not normally contain sodium bicarbonate, but it will be added by the manufacturer during the manufacturing process. The addition of the sodium bicarbonate is to provide additional buffering capacity to the aquifer to reduce the pH reduction that can occur as the substrate ferments while in the aquifer. There was no additional cost for the addition of sodium bicarbonate to the SRS®-SD.*

# Response to Comments

- TT IMWP Comment #4: Section 3.2 – It is our understanding that SRS-B contains ingredients for aquifer buffering (based on Terra Systems' website). Please confirm if sodium bicarbonate is in the costed product (SRS-SD) or if a custom formulation was derived for CRHE. Will any additives result in secondary UIC issues (e.g., addition of sodium bicarbonate forming sodium salts)?

- *Response: There was no additional cost for adding sodium bicarbonate to the SDS®-SD. SRS®-B is formulated for low pH aquifers and has 5 to 15% buffer. Per the FDEP Acceptance Letter provided in Appendix D of the IMWP, UIC monitoring associated with the injection of SRS®-SD requires monitoring of sodium, total dissolved solids, and total recoverable petroleum hydrocarbons. Since the UIC monitoring includes sodium, there should be no secondary UIC issues. Also, by approximating the resulting concentration of sodium in the 305,000 gallons of pore volume, the concentration of sodium in the aquifer due to the addition to 8 g/L of sodium bicarbonate to the SRS®-SD is less than 0.03 g/L, and the KSC Upper Range of Background for sodium is 15 g/L (FDEP GCTL is 0.16 g/L).*

# Response to Comments

- Jacobs ADP Comment #1: General – Please discuss the substitution of SRS®-SD for EOS®, and the flow-down changes (such as dilution), plus any other factors that were notably different between Step 2 assumptions and Step 3 design. This will provide the Remediation Program with clear documentation of the reason for the change in capital cost. We do not disagree with the selection of SRS®-SD, but since EOS® was presumed to yield representative costing for whatever amendment was developed in Step 3 and there was a notable increase in cost, the reason for selection should be described.

# Response to Comments

- *Response: The changes between the Step 2 and the Step 3 EE included the following: (i) modification of the electron donor from EOS® to SRS®-SD; (ii) increasing the dosing of the electron donor from 0.5% to 0.7%;(iii) the method of calculating the pore volume of the treatment area (considering overlap and drift outside the treatment area); and (iv) an increase in number of DPT sampling days from three to five. A description of our rationale for these modifications is provided below.*

  *The decision to substitute SRS®-SD for EOS® stemmed from our experience with both products. Over the past couple of years, the EOS® products have arrived at our sites with a pH that was less than 6, which is below neutral and can influence the pH of the aquifer. SRS®-SD has a neutral pH and we have had positive results.*

  *The SRS®-SD costing provided was their estimated 2015 costing ($940/drum), since NASA is anticipating this IM will not be implemented until 2015 (The estimated 2014 pricing is ~$882/drum). The cost for EOS provided in the Step 2 EE was an anticipated 2014 cost and they were not able to provide us an estimated cost for 2015. This change affected the cost because the cost of a drum of SRS®-SD is approximately $940/drum and the cost of a drum of EOS® was approximately $730/drum.*

  *The decision to increase the electron donor dosing from 0.5% to 0.7% was based on comments received during the Step 2 EE that were concerned that the dosing of 0.5% was low. As stated in the IMWP, Geosyntec generally recommends a dosing of 0.5% to 1% of pore volume (with oil); therefore, the dosing was increased to 0.7%. This change affected the cost because the volume of EVO increased. The cost increase is discussed below.*

  *During the Step 2 EE, the treatment volume was estimated by using the area of the SZ times the treatment interval (3,050 square feet x 30 feet). For the IMWP, since the treatment interval varied by location, the pore volume was calculated for each injection location (assuming an 8-foot radius of influence and a specific treatment interval), and then summed to provide a total treatment volume. This approach more accurately reflects the total treatment volume, since it includes the overlapping of the radius of influence (in addition to the treatment of some areas outside the specific SZ iso-contour). The change in this calculation increased the total treatment volume (from ~ 200,000 gallons to 300,000 gallons), which increased the amount of EVO solution required and increased the number of days that injections would occur.*

# Response to Comments

- *Response (cont.):*

  *The cost from the Step 2 EE and the Step 3 EE were compared based on the cost per cubic yard treated. A summary of the cost is provided below:*

  - *Step 2 EE cost*
    - *~$129/cy based on total cost for 3 years ($437,000) and cubic yards treated (3,390 cy)*
    - *~$164/cy based on total cost for 5 years ($557,000) and cubic yards treated (3,390 cy)*
  - *Step 3 EE cost*
    - *~$145/cy based on total cost for 3 years ($626,500) and cubic yards treated (4,317 cy)*
    - *~$164/cy based on total cost for 5 years ($708,700) and cubic yards treated (4,317 cy)*
  - *The costs summarized above show that from the Step 2 EE to the Step 3 EE, the treatment volume has increased, but that the cost per cubic yard is similar.*

Geosyntec consultants

# Bioremediation Layout Plan View

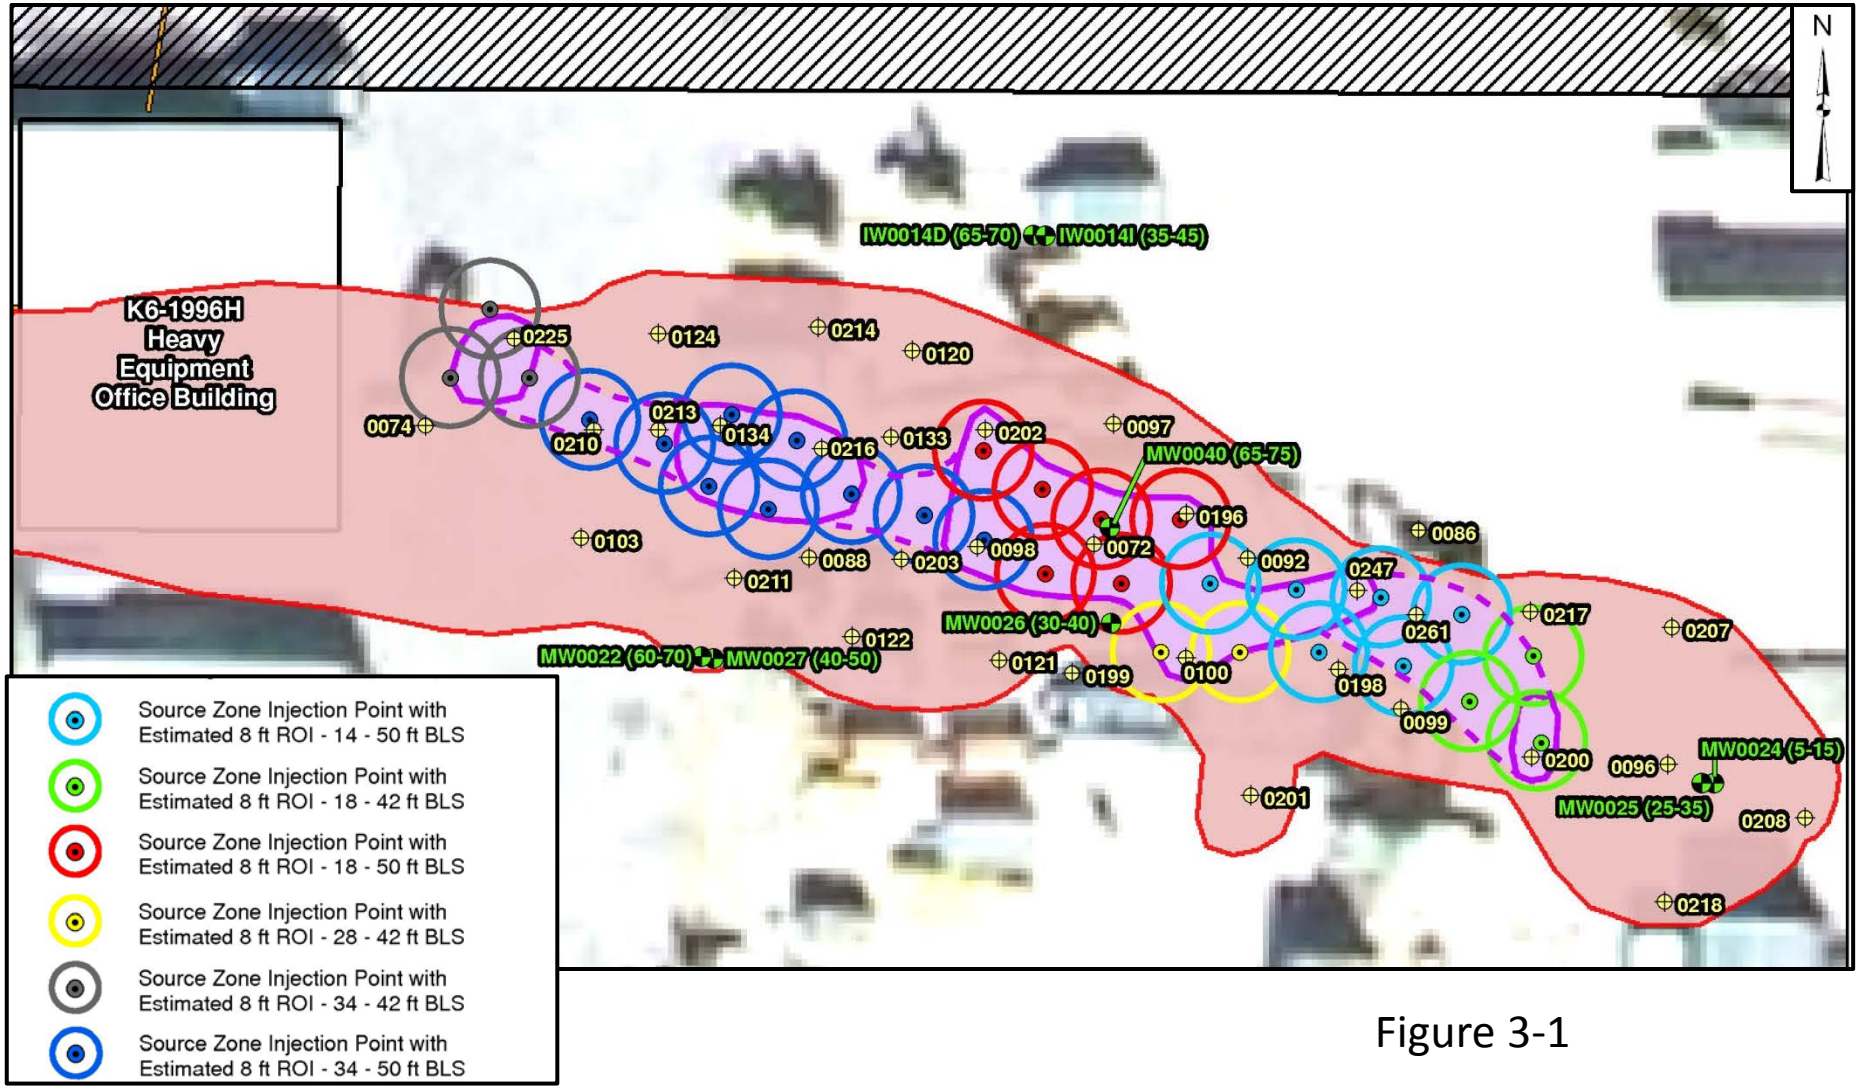

Figure 3-1

# Response to Comments

- TT ADP Comments #2: Slide 11 (new slide 23) – Suggest numbering DPT points and providing a reference injection calculation (See IMWP table)

- *Response: The DPT injection locations can be numbered as part of the IM Implementation Work Plan.*

# Response to Comments

- Jacobs IMWP Comment #9: Section 4 – MW0026 is located along the southern edge of the SZ treatment area. Due to its proximity to the treatment area, consider abandoning and re-installing MW0026 due to preferential pathway concerns and potential daylighting issues.

- *Response: If the injection technique proposed in the IMWP is utilized, we do not anticipate daylighting issues at monitoring well MW0026 (no daylighting issues occurred at LC34 Hot Spot 1 where we had monitoring wells [with secure caps] within 2 feet of injection locations). If an alternative injection vendor/technique is ultimately utilized, the abandonment of the well should be considered in the IM Implementation Work Plan.*

# Injection Interval Rationale

- Based on DPT groundwater sampling data
  - Injection interval expanded to include a couple of feet above and below sample interval
  - If no sample collected from 46 to 50 ft BLS, injection interval extended to 50 ft BLS
- 18 to 42 ft BLS for the injection locations around DPT0200
  - DPT0200 and DPT0217 - 10xNADC CVOC exceedances from 21 to 40 ft BLS
- 14 to 50 ft BLS for the injection locations around DPT0247
  - DPT0247 - 10xNADC CVOC exceedances from 16 to 45 ft BLS (no sample collected below 45 ft BLS)
- 18 to 50 ft BLS for the injection locations around DPT0196, DPT0072, and DPT0202
  - DPT0196 - 10xNADC CVOC exceedances from 21 to 45 ft BLS (no sample below 45 ft BLS)
- 28 to 42 ft BLS for the injection locations around DPT0100
  - DPT0100 - 10xNADC CVOC exceedances from 31 to 40 ft BLS
- 34 to 50 ft BLS for the injection locations around DPT0098, DPT0216, DPT0134
  - DPT0216 - 10xNADC exceedances from 36 to 45 ft BLS (no sample collected below 45 ft)
- 34 to 42 ft BLS for the injection locations around DPT0225
  - DPT0225 - 10XNADC CVOC exceedances from 36 to 40 ft BLS

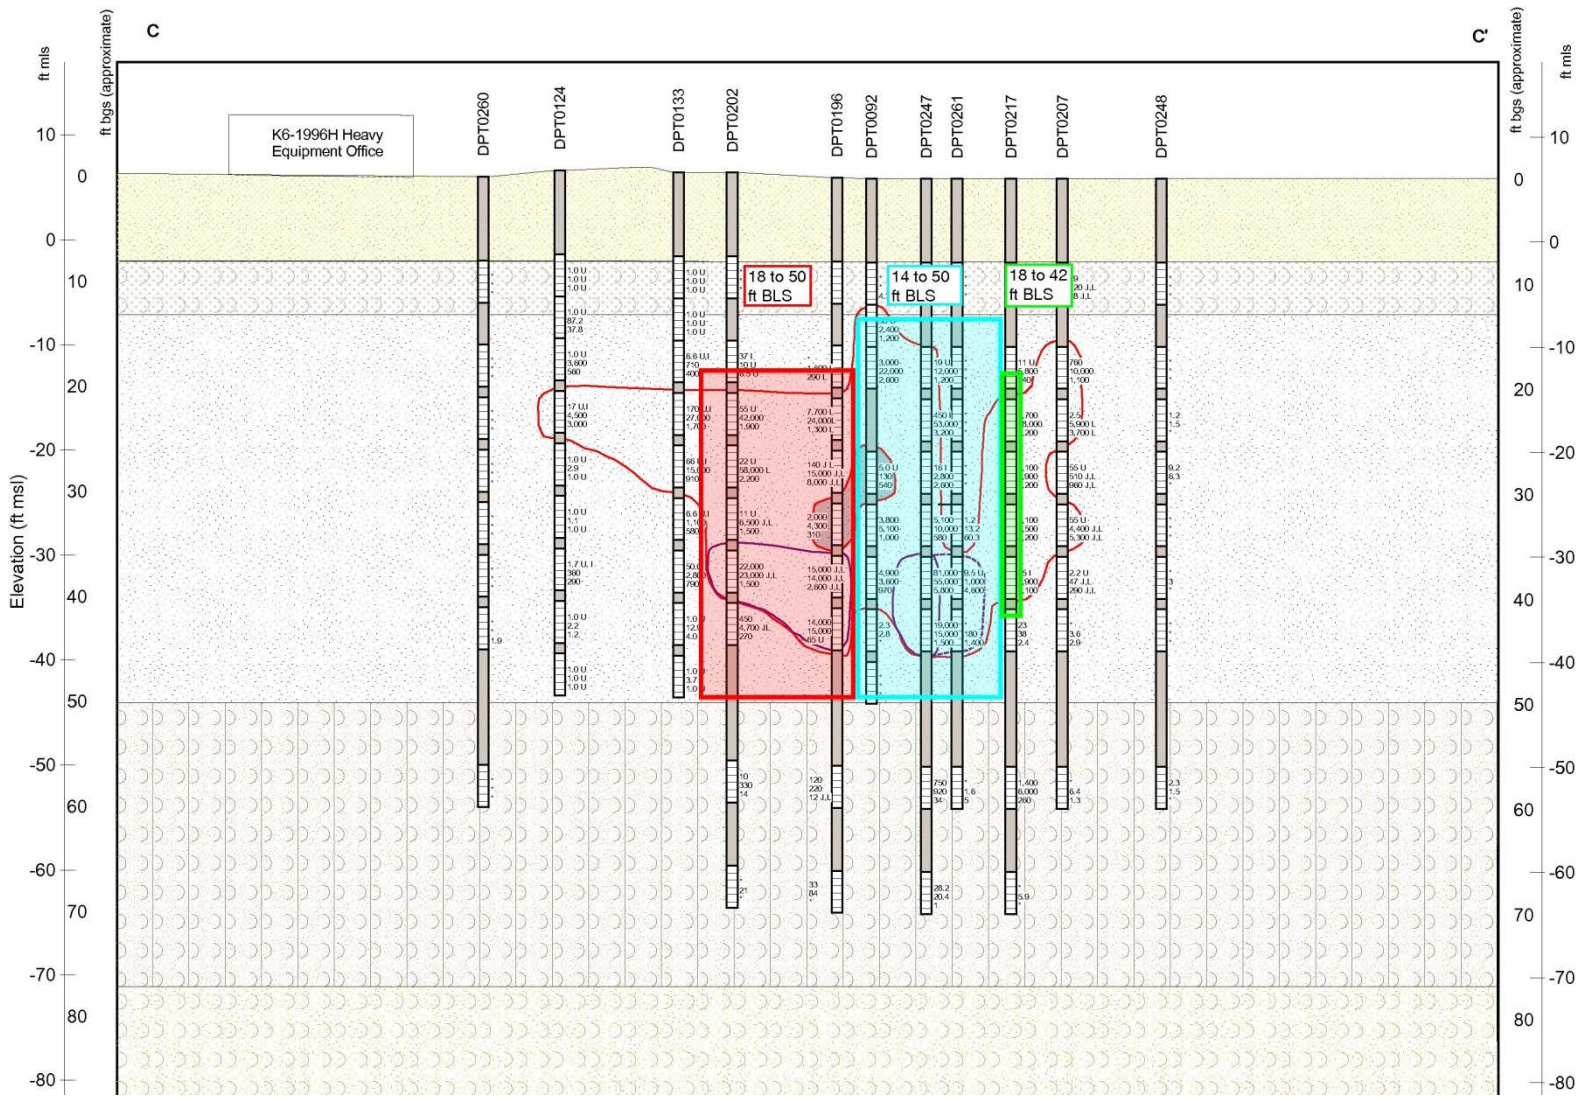

Figure 3-3

# Response to Comments

- Jacobs ADP Comment #3: Slide 14/15 (new slide 27/28) – Treatment depths on Figures 3-2 and 3-3 (slides 14 and 15) are presumably indicated by the color blocks, but there is no legend or key to that effect. Recommend adding a call-out or legend.

- *Response: A printing error caused the injection intervals to not be presented on Figures 3-2 and Figures 3-3. The figures are presented correctly in the ADP, and have been reprinted and provided to the Team.*

# Response to Comments

- TT ADP Comment #3: Slide 14/15 (new slide 27/28) – Figures 3-2 and 3-3 do not match these figures. Please revise, as commented in IMWP.

- *Response: See response to Jacob's ADP comment #3.*

# Response to Comments

- TT IMWP Comment #8: Figure 3-2/3-3 – It is not clear what this figure is presenting, as injection locations and intervals are not depicted. Please revise showing applicable injection locations and treatment interval within the cross section. See Slides 14 and 15 of the Step 3 EE.

- *Response: See response to Jacob's ADP comment #3.*

# Electron Donor Dosing Appendix E IMWP

- 71 drums of SRS®-SD diluted 1:80
  - ~298,000 gallons of SRS®-SD solution
  - Water will be treated with dechlorinator and made anaerobic by adding sodium sulfite, if necessary
- 50 gallons chase water per injection interval
  - ~3,250 gallons of chase water

| Treatment Interval | Number of Injection Points | Drums of SRS-SD (52.5 gal per drum; 60% EVO) | Volume of Diluted SRS®-SD Solution | Volume of Diluted SRS®-SD Solution per Location |
|---|---|---|---|---|
| (ft BLS) | N/A | N/A | (gal) | (gal) |
| 14 to 50 | 6 | 22 | 92,400 | 15,400 |
| 18 to 42 | 3 | 8 | 33,600 | 11,200 |
| 18 to 50 | 6 | 20 | 84,000 | 14,000 |
| 28 to 42 | 2 | 3 | 12,600 | 6,300 |
| 34 to 42 | 3 | 3 | 12,600 | 4,200 |
| 24 to 50 | 9 | 15 | 63,000 | 7,000 |
| **Total** | **29** | **71** | **298,200** | **---** |

# Response to Comments

- TT IMWP Comment #6: Section 3.3.3 - Were costs and time required for conditioning dilution and chase water included in the design? For example, how many and what size tanks will be required and how much dechlorinator and oxygen scavenger will be required.

- *Response: Yes, time was considered; however, it is minimal when using the sodium sulfite as presented in the IMWP. The number and size of tanks is an Implementation Work Plan Detail.*

  *Note that for the evaluation in the IMWP, the mixing was based upon the vendor using 250-gal mixing tanks as described in Section 3.3.3. As described in Section 3.3.3 of the IMWP, 0.24 g/gal of sodium sulfite would be added (calculations included in Appendix E). The amount of dechlorinator added would change based on product (or natural conditioning may be feasible).*

# Response to Comments

- Jacobs ADP Comment #4: Slide 16 (new slide 32) – Please include the assumptions used to generate the volume estimates in the chart on Slide 16 (porosity, pore space saturation, ROI, vertical thickness, etc.). We found these in Appendix E of the IMWP.

- *Response: Slide 16 is a summary of the information presented in Appendix E of the IMWP. A reference to Appendix E has been added to the slide, since the ADP and IMWP are meant to be complimentary documents.*

# Response to Comments

- Jacobs IMWP Comment #1: Section 3 - Agree with the injection locations and treatment intervals. Expanding the treatment zone where there was no 46-50 ft bls sample is a good, conservative approach.

  Please include a preliminary injection details table (understanding that this will be finalized in the implementation work plan). This table should include injection location identification, GPS coordinates of the injection location, injection depths/lifts, and volume of SRS®-SD/water solution per lift. The table should be inserted into Section 3 of the IMWP.

- *Response: A table detailing the injection details is provided in Appendix E. This table (Electron Donor Dosing and Injection Volume Calculations) provides details for the injection locations based on depth interval. The information provided includes the following: (i) treatment interval; (ii) the number of 2-foot injection lifts within this interval; and (iii) the volume of solution per lift. A table or figure providing the injection location GPS coordinates should be included in the IM Implementation Work Plan. To provide maximum flexibility to NASA for implementation, the injection details were kept generic such that the A&E/vendor implementing the project has the ability to tailor the implementation to their technical strategy/vendor equipment.*

# Response to Comments

# Response to Comments

- TT IMWP Comment #5: Section 3.3.1 – Please include a table/calculation (with figure referencing locations) showing the injection criteria and assumptions for each injection point. This would include information such as coordinates, treatment interval, groundwater volume, dosage concentration, substrate volume, chase water volume, lift length, lifts per boring, substrate and chase volume per lift, etc.

- *Response: See response to Jacobs's IMWP comment # 1.*

# Response to Comments

- TT IMWP Comment #13: Appendix E - Please provide entire calculation, as the provided hard copy calculation could not be reviewed since it only shows the outputs and inputs, assumptions, and calculations are not provided. Note that a CD was not received to check if this information was to be provided electronically.

- *Response: Appendix E provides the assumptions and calculations (the equations used in all the calculations are in the heading of each column) for each step for the Electron Donor Dosing and the ROI calculations. The substrate estimating tool was produced by ESTCP. The EE step process does not require that source files for all calculations, models, etc. be provided on a CD for review.*

# Injection Design

- Injection performed by DPT injection subcontractor
  - Two DPT rigs
  - 2-ft injection tool
  - Inject from bottom up
  - Inject at a max of 10 locations simultaneously
  - Manifolds to each injection location will have flow meter, flow controller and pressure gauge
- Injections anticipated to take approximately 18 days
  - 2 to 7 gpm (anticipated to average 4 gpm)
- Collect water level measurements during injection to monitor that significant mounding does not occur

# Response to Comments

- TT General Comment #1: – Per IMWP/Step 3 EE requirements, please provide a P&ID for bioremediation equipment (in this case, a PFD would be appropriate). Please also provide details for injection point manifolding and details relating to how each point will be lifted following injection at the multiple locations (stated at up to 10 injections simultaneously).

- *Response: P&ID and PFDs for bioremediation using DPT are vendor specific. Exact details about injection lifting and manifolding will be provided in the implementation work plan when a vendor is selected by the A&E implementing the project. We do not believe that providing details regarding how each injection point will be manifolded and how each point will be lifted following injection provides the level of flexibility desired by NASA. The referenced information should be included in the implementation work plan.*

# Response to Comments

- TT IMWP Comment #5: Section 3.3.1 – Since specific vendor and subcontractors cannot be selected at a design stage and contracting mechanisms require competitive bidding, please include "or approved equivalent" or similar language when specifying products and services.

- *Response: We assume this comment is referring to the following sentence:*

  *"The SRS®-SD amendment will be injected into the subsurface by a DPT injection subcontractor (worked scoped assumed the use of Vironex, Inc.)"*

  *We intended the above language in the text to allow for the use of any vendor (which was the intent). The text above was meant to provide information on how we costed and scoped the work. The text will be modified to also include the "or approved equivalent" language.*

# Response to Comments

- TT IMWP Comment #7: Section 3.3.3 – The text indicates that injection activities will occur at up to 10 locations, simultaneously. Can more information be provided to detail the specific approach for injections (i.e.: injection point sequencing, etc.)?

- *Response: Based on information provided by Vironex, they will provide the equipment to allow the injections to occur at up to 10 locations simultaneously. We believe it is best to determine the injection point sequencing in the field, since the number of locations that can be injected into simultaneously will be dependent on how the formation accepts the injectate, proximity to previously abandoned locations, etc.*

# Response to Comments

- Jacobs IMWP Comment #2: Section 3 – Were any other DPT injection techniques considered in addition to the drop-tip injection method? A technique that includes active pore space dilation or that induces more pressure may reduce the overall field time and would reduce the volume of water required, while still achieving the required 8 ft ROI.

- *Response: By active pore space dilation, we are assuming this terminology is referring to fluidizing and/or fracturing the formation (dilation of pore spaces) using high flow and pressure (kinetic energy) applications. We have used this approach (as well as others) at KSC, and elsewhere in Florida, as well as the Vironex system which is the system proposed in this IMWP (note the IMWP does not require the Vironex approach). The Vironex system achieved distribution objectives at LC34 Hot Spot 1 as a delivery system; therefore, we proposed the use of the Vironex system in the IMWP.*

# Response to Comments

- Jacobs IMWP Comment #4: Section 3 – Include a section regarding proper abandonment of injection boreholes. The implementation section should also include a strategy for how injections will occur around previous completed injection locations. Proper abandonment and injection strategy is imperative in minimizing the potential of daylighting, as you know.

- *Response: The injection boreholes will be abandoned by tremie grouting the boreholes, and this information will be added to the IMWP. Information on injection strategy should be included in the IM Implementation Work Plan, since it will ultimately be dependent on the equipment/vendor utilized for the injection work.*

# Response to Comments

- Jacobs ADP Comment #5: Slide 17(new slide 39) – Please call out the wells that will be monitored to ensure that mounding does not occur.

- *Response: Proposed monitoring wells MWA, MWC, MWF, and MWH and existing monitoring wells MW0024, MW0026 and IW0014I will be monitored for mounding. This information will be added to the IMWP.*

Geosyntec consultants

# Proposed Monitoring Wells

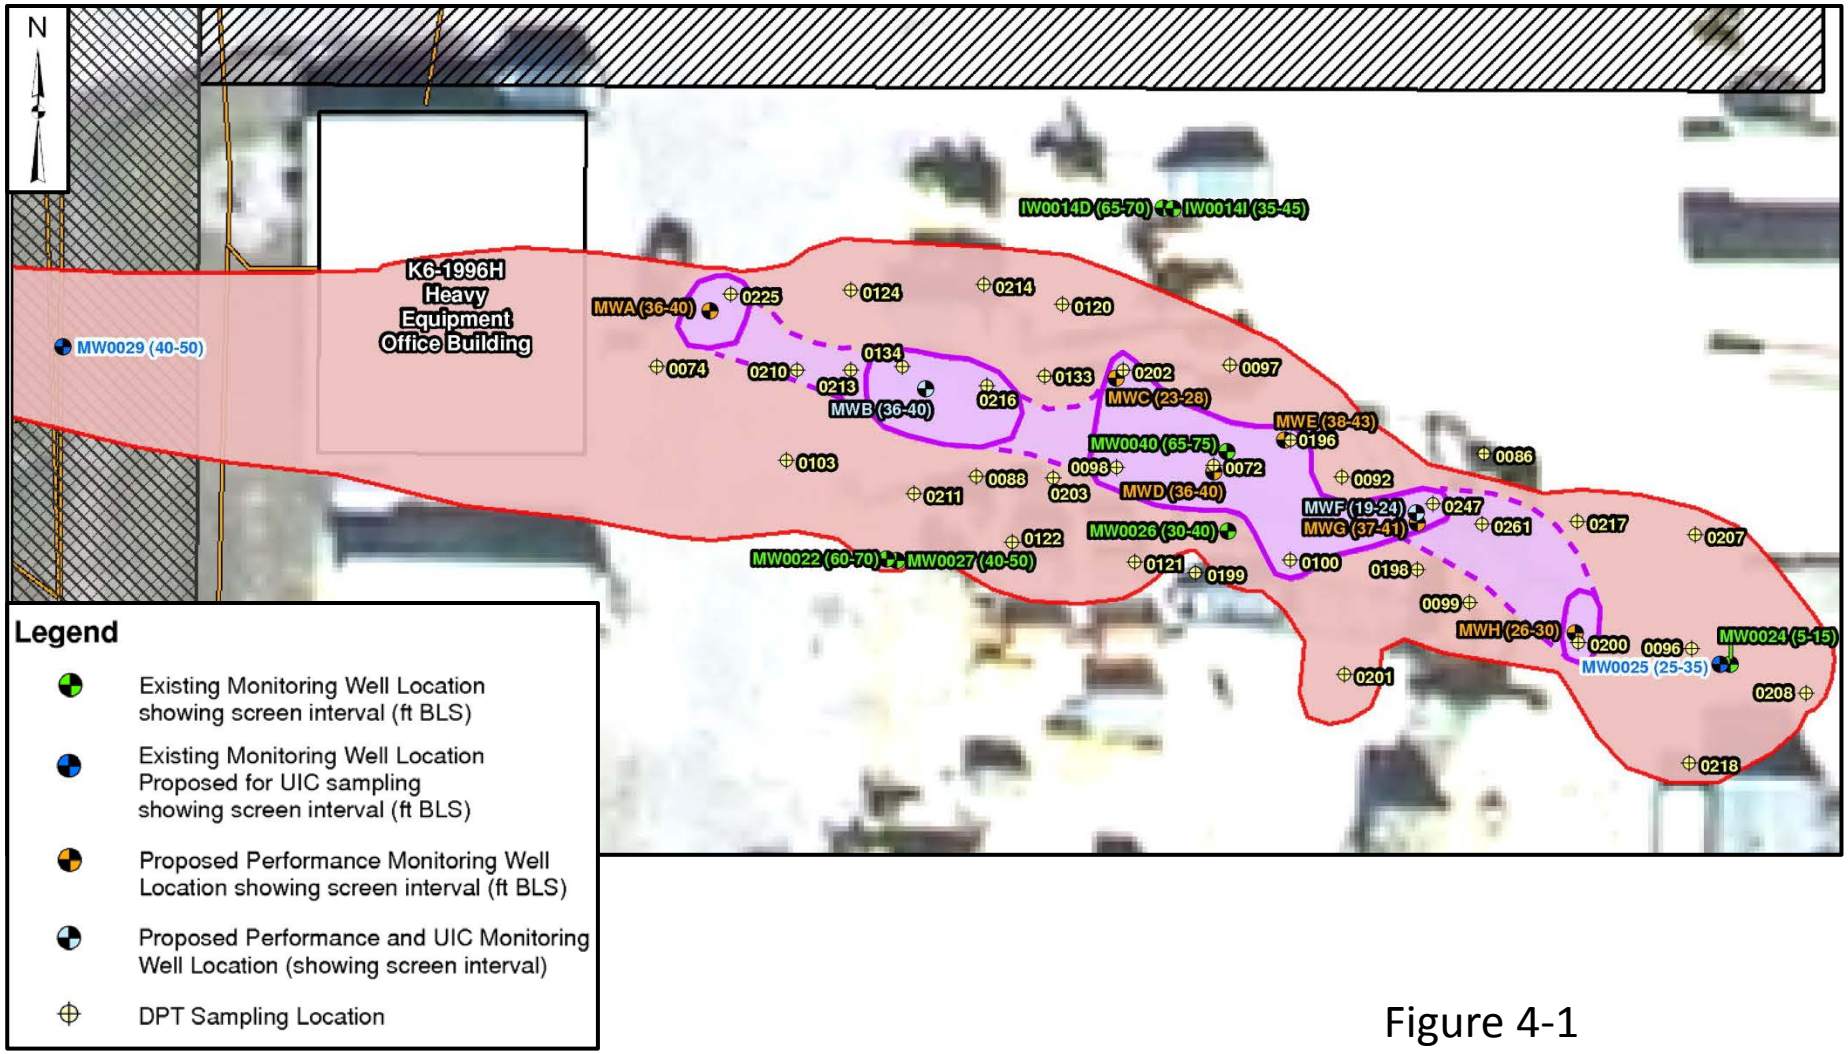

Figure 4-1

Geosyntec consultants

# Proposed Monitoring Well Rationale

- MWA (36 to 40 ft BLS) – TCE concentration greater than 1% solubility from 36 to 40 ft BLS at DPT0225
- MWB (36 to 40 ft BLS) – TCE concentration greater than 1% solubility from 36 to 40 ft BLS at DPT0134 and DPT0216
- MWC (23 to 28 ft BLS) – CVOC concentrations greater than 10xNADC from 21 to 30 ft BLS at DPT0202
- MWD (36 to 40 ft BLS) – TCE concentrations greater than 1% solubility from 36 to 40 ft BLS at DPT0072
- MWE (38 to 43 ft BLS) – TCE concentrations greater than 1% solubility from 36 to 45 ft BLS at DPT0196
- MWF (19 to 24 ft BLS) – CVOC concentrations greater than 10xNADC from 16 to 25 ft BLS at DPT0247
- MWG (37 to 41 ft BLS) – TCE concentrations greater than 1% solubility from 36 to 45 ft BLS at DPT0247
- MWH (26 to 30 ft BLS) – TCE concentration greater than 1% solubility from 26 to 30 ft BLS at DPT0200

# Response to Comments

- Jacobs IMWP Comment #5: Section 4 – Overall, we agree with the location and intervals of the new performance monitoring wells. At DPT-202, 10x NADC exceedances are observed over the 21-30 ft bgs interval. TCE 1% solubility exceedances are observed over the 36-40 ft. interval. The IMWP only proposes installing a performance monitoring well at the 23-28 ft. bgs interval. Consider installing another performance monitoring well at this proposed location over the 36-40 ft. bgs interval.

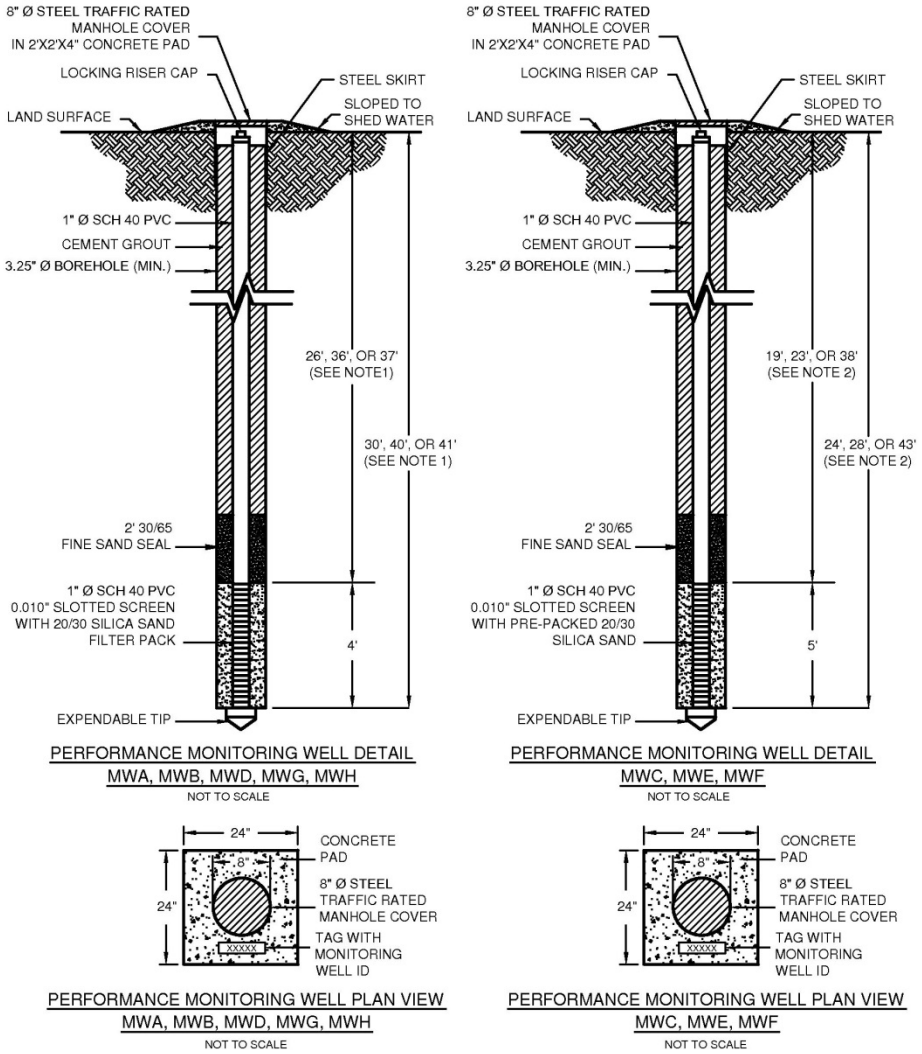
- *Response: The monitoring plan was designed with a minimum number of monitoring wells to reduce costs, while still providing adequate information to evaluate the bioremediation implementation (understanding that a robust DPT groundwater sampling event would also occur). The screen interval (23 to 28 ft BLS) for proposed monitoring well MWC at location DPT0202 was selected to monitor the shallow CVOC concentrations that are greater than 10XNADC in that area. There are six other proposed monitoring wells that are screened in the interval where TCE concentrations are greater than 1% solubility (MWA, MAB, MWD, MWE, MWG and MWH). Based on the rationale provided, we do not believe that a monitoring well screened from 36 to 40 ft BLS at DPT0202 is warranted.*

# Response to Comments

- Jacobs IMWP Comment #10: Section 4 – Due to preferential pathway concerns and potential daylighting issues, performance monitoring wells should be installed after groundwater injections are complete. DPT VOC concentrations can be used for baseline comparisons instead. MW0024, MW0025, and MW0026 could be used to monitor for mounding during injections.

- *Response: See response to comment #9. Proposed monitoring wells MWA, MWC, MWF, and MWH and existing monitoring wells MW0024, MW0026 and IW0014I will be monitored for mounding.*

# Monitoring Well Construction Details



- 1-inch SCH 40 PVC
- 4 or 5 ft screen interval
  - Focused on impacted interval
  - 20/30 sand pack
- 8-inch manhole
- 2′ x 2′ x 4 ″ concrete pad

Figure 4-2

# Response to Comments

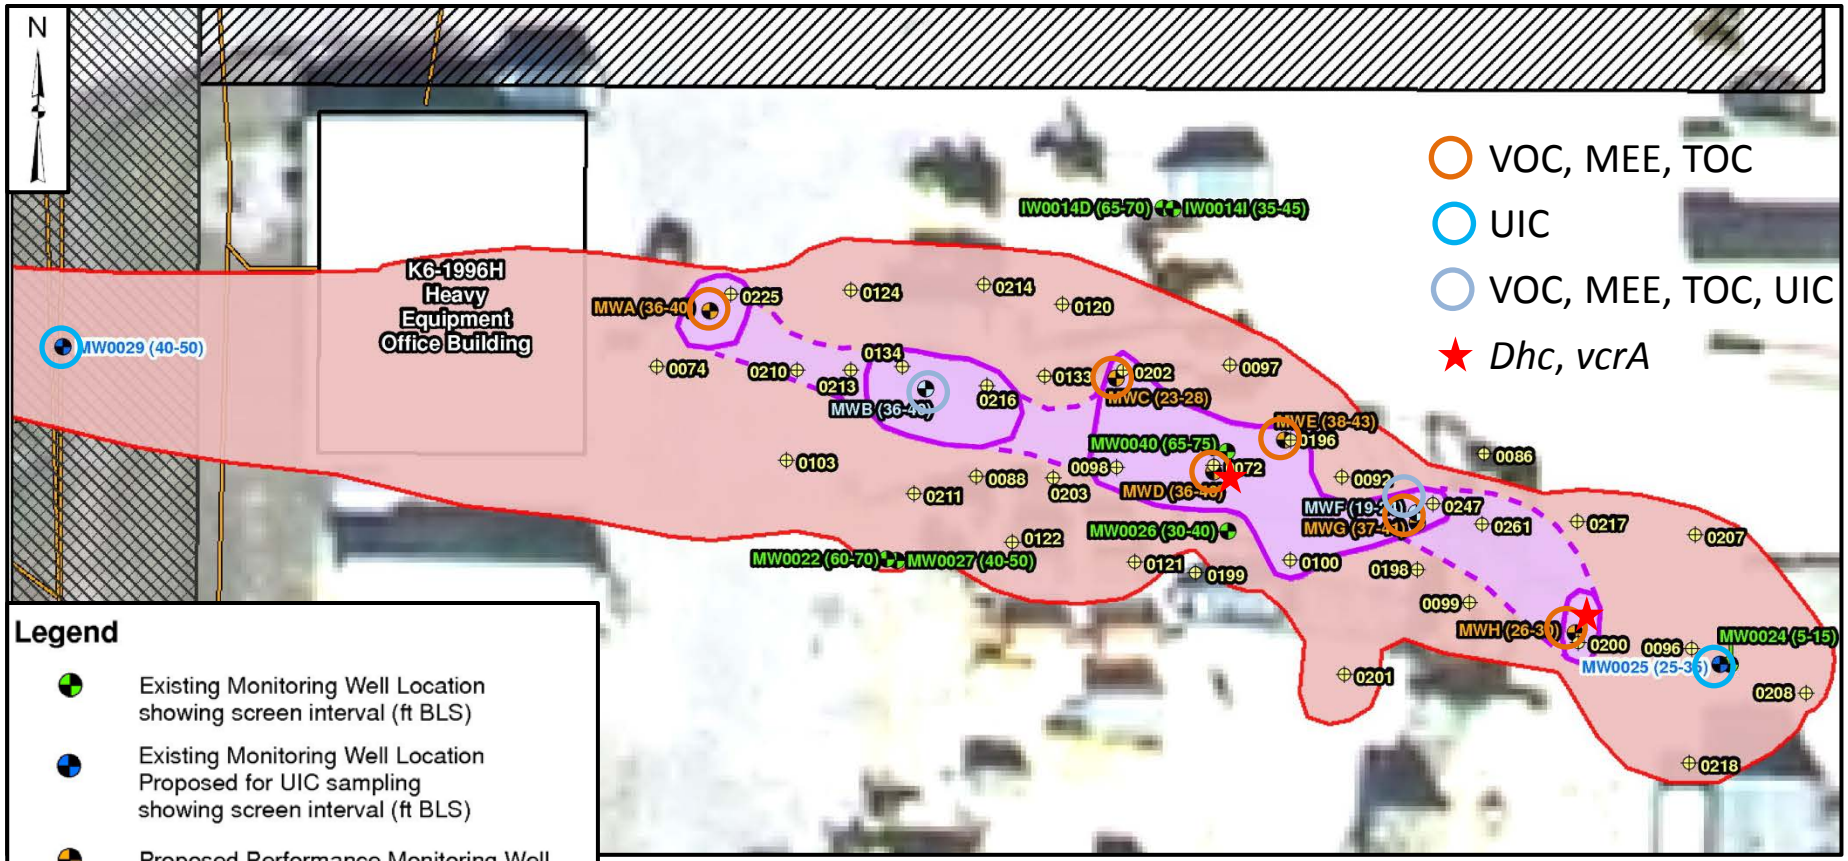
- Jacobs IMWP Comment #13: Section 4 – Monitoring wells at the GSA Reclamation Yard IM were installed with a 2' x 2' x 4" concrete pad and traffic vaults. Due to the heavy equipment traffic at GSRY, several of the pads and wells were damaged. Consider installing more robust pads (3' x 3' x 6" with reinforcement, or better) in an attempt to better withstand the heavy equipment traffic that will likely be present at CRHE.

- *Response: Geosyntec concurs and proposes to use 2′x2′x6″ reinforced pads and the IMWP will be updated to reflect this.*

# Performance Monitoring
## UIC Monitoring

- UIC monitoring is required with the injection of SRS®-SD
  - FDEP requires the monitoring of TDS, TRPH, and sodium
  - Four monitoring wells will be sampled for UIC parameters
    - Upgradient monitoring well - MW0025
    - Downgradient monitoring well - MW0029
    - Two proposed wells within the plume - MWB (36 to 40 ft BLS) and MWF (19 to 24 ft BLS)

# Performance Monitoring



**Legend**

- Existing Monitoring Well Location showing screen interval (ft BLS)
- Existing Monitoring Well Location Proposed for UIC sampling showing screen interval (ft BLS)
- Proposed Performance Monitoring Well Location showing screen interval (ft BLS)
- Proposed Performance and UIC Monitoring Well Location (showing screen interval)
- DPT Sampling Location

- Baseline sampling
- Semi-annual performance monitoring
- Semi-annual UIC monitoring

Table 4-1

# Response to Comments

- Jacobs IMWP Comment #12: Section 4 – If bioaugmentation is being considered as part of the remedial action, baseline sampling should include a *Dhc* census (including tceA and vcrA), at a minimum.

- *Response: Analysis of groundwater samples for Dhc and vcrA is proposed as part of the IM at proposed monitoring wells MWD (36 to 40 ft BLS) and MWH (26 to 30 ft BLS). The analysis for Dhc will provide information on the size of the Dhc population and the vcrA gene will provide information on the reductase gene responsible for VC to ethene dechlorination. The tceA gene is the Dhc reductase gene that is responsible for dechlorination of TCE to VC. We believe that quantifying the Dhc population and the vcrA gene provides valuable information and that quantifying the tceA gene is not necessary.*

# Response to Comments

- Jacobs IMWP Comment #6: Section 4 – All UIC sampling locations are located along the center line of the treatment area. No UIC sampling locations are located along the perimeter of the treatment area to monitor for any lateral movements that could potentially result from the groundwater injections. Consider adding MW0026 to the UIC sampling routine.

- *Response: We believe the upgradient (MW0025) and downgradient (MW0029) UIC monitoring wells are adequate to monitor if groundwater outside the injection area is impacted by the injectate.*

# Response to Comments

- Jacobs IMWP Comment #7: Section 4 – MW0029 is located approximately over 150 ft away from the treatment area and is screened below the treatment depths. Consider replacing MW0029 with IW0014I for UIC sampling or install a well over the 30-40 ft bgs interval west of the treatment area.

- *Response: Monitoring well MW0029 is included as a UIC well to evaluate if there is migration downgradient of the injection area. The injections will occur from 14 to 50 ft BLS; therefore, the screen interval of monitoring well MW0029 (40 to 50 ft BLS) is appropriate. We do not believe the addition of monitoring well IW0014I is necessary (see response to comment #6 above).*

# Response to Comments

- Jacobs IMWP Comment #8: Section 4 – The majority of the performance monitoring sampling is within the treatment the SZ treatment area. Consider adding monitoring wells that are outside the treatment area to better determine the overall effectiveness of the remedial action. Propose adding MW0025 and MW0027 to monitor the 10 x NADC exceedance areas. Also, consider adding MW0026 to the performance monitoring schedule to monitor the perimeter along the SZ treatment area.

- *Response: The area outside the SZ will be monitored as part of the Interim Groundwater Monitoring (IGM) program (The IGM Plan is currently being prepared and will be presented with the next Step 1 EE). Our primary monitoring focus for this IM is to evaluate the performance of bioremediation inside the source zone. It is anticipated that DPT sampling will be performed approximately 1 to 2 years following the injection, and groundwater samples can be collected from the CVOC 10X NADC area, if deemed appropriate.*

# Response to Comments

- Jacobs IMWP Comment #11: Section 4 – Consider sampling MWD and MWH for dissolved hydrogen gas on an annual basis during the performance monitoring sampling events.

- *Response: Dissolved hydrogen concentrations are not necessary for the evaluation of dechlorination of CVOCs. Hydrogen is the only electron donor that Dehalococcoides (Dhc) can utilize to dechlorinate CVOCs, but other information can be used to evaluate if dechlorination is occurring. As part of this IM, CVOCs, total organic carbon (provides information about electron donor), methane, ethane, and ethene (provides information on whether complete dechlorination is occurring), and Dhc and vinyl chloride-reductase (vcrA) (provides information on organisms and genes responsible for dechlorination) will be monitored. These constituents provide more than adequate information to evaluate the progress of microbial mediated reductive dechlorination.*

# Post-Injection Monitoring

- Supplemental DPT sampling
  - Anticipated to occur 1 to 2 years after injection
  - Provide a more robust understanding of CVOC concentrations
  - Aid in design of additional injection, if required
  - Sample at, or adjacent to, previous DPT locations an/or along centerline of plume

# Additional Injection

- Costing for an additional injection, if warranted, includes the following
  - 37 drums of SRS®-SD (~50% dosing)
  - Injection at all 29 locations and across same treatment interval
  - 298,000 gallons of SRS®-SD solution
  - Water will be treated with dechlorinator and made anaerobic if necessary
  - 50 gallons chase water per injection interval
    - ~3,250 gallons of chase water
  - Information included in UIC memo

# Response to Comments

- TT IMWP Comment #10: Section 6.3 – Information relating to a secondary injection event is not provided in detail. Since there is potential for a secondary injection event, please provide additional information.

- *Response: The details of a second injection event would be based on the results from the performance monitoring and the DPT groundwater sampling event; therefore, it the details of a second injection event have not been included in this IMWP.*

# Response to Comments

- TT IMWP Comment #11: Section 6.3 – If a secondary injection event is required, the monitoring duration would most likely extend to at least 5 years (i.e., ~2-3 years first injection, 2+ years second injection, 1+ years post-remediation monitoring). Please confirm monitoring durations.

- *Response: The monitoring duration is dependent on whether there is a second injection event and the results from the performance monitoring; therefore, the monitoring duration was not stated. Costs are included for monitoring up to 5 years to be conservative.*

# Cost Estimate

- Detailed costing included in Table 6-1
  - Capital Cost (including baseline sampling) - $280,000
  - Annual monitoring and reporting - $40,000 per year
  - Supplemental DPT sampling - $30,000
  - Additional injection event - $195,000

- Total implementation cost
  - 1 year of monitoring - $320,000
  - 3 years of monitoring - $630,000
  - 5 years of monitoring - $710,000

# Response to Comments

- TT IMWP Comment #12: Table 6-1 – The IMWP costs for bioremediation are approximately $80,000 higher than the highest-range costs for air sparging. Please add a slide refreshing the screening criteria between bioremediation and air sparging to validate proceeding with bioremediation in reference to the updated costs completed in the Step 3 EE. We acknowledge that bioremediation is preferred, since site interferences are decreased.

- *Response: The cost details are provided in the response to Jacobs's ADP comment #1.*

  *The technology evaluation summary from the Step 2 EE is provided below.*
  - *Why not air sparging?*
    - *Trenching at an active facility with large pieces of equipment and personnel that work in the area*
    - *Heavy equipment will likely require specialty vault boxes and geotech evaluation for trenching*
    - *Likely mounding from AS and possible entrainment issue with SVE*
    - *Scale up/expansion issues (when looking at plume as a whole) – due to presence of road/railroad yard and woods/wetland*
    - *Engineering solutions can be developed, but there are risks*
  - *Why Bioremediation?*
    - *Passive implementation*
    - *Ideal geochemistry*
    - *Reduced O&M&M (monitoring only)*
    - *Amenable to scaling*
    - *More cost effective than EZVI*

# Response to Comments

- TT ADP Comment #4: Slide 25 (new slide 63) – Based on site conditions and remedy assumptions, how long does Geosyntec anticipate monitoring most likely to be required (i.e., which implementation cost is most likely)? A second injection event is fairly typical as a polishing step and may be logically required, making the interim measure a 5+ year option realistic.

- *Response: Monitoring of the passive IM is anticipated to be 3 to 5 years. Additional monitoring of the area will likely be required and those costs are not included in this IMWP.*

# Cost Estimate

- TT IMWP Comment #9: Section 5 – It is our understanding that the Step 4B EE may not be a requirement for future IMs. We suggest Geosyntec discuss with the RPM whether to retain the Step 4 B EE.

- *Response: After discussion with the RPM, the Step 4B will be removed from the IMWP and the costing.*

# MEMORANDUM

| | |
|---|---|
| Date: | 13 May 2014 |
| To: | Anne Chrest |
| Copies to: | NASA Remediation Team |
| From: | Rebecca Daprato, Ph.D., P.E., Jim Langenbach, P.E., BCEE, and Jill Johnson, P.G. |
| Subject: | Contractor's Road Heavy Equipment Area Hot Spot 1 Step 3 Engineering Evaluation and IM Work Plan – Response to Comments |

Comments on the Step 3 Engineering Evaluation and IM Work Plan were received and are addressed below. The comment is listed first and Geosyntec's response is provided in italics below the comment.

**Jacobs Comments:**

Jacobs has reviewed the Step 3 Engineering Evaluation (EE) IM Work Plan (WP) and ADP for the CRHE Area. We generally concur with the Source Zone treatment preliminary design presented in the IMWP and ADP (SZ; TCE >11,000 ppb).

We have two general comments to suggest for Team discussion, rather than for Geosyntec to address. First, it is difficult to review the ADP without referring to the IMWP to fully understand the approach. Sometimes it is a simple thing (incomplete legends on ADP figures, probably in the interest of presentation on a slide). Others are technical; for example, dosing assumptions/calculations were found only in the IMWP. The Team should consider discussing the level of detail for a Step 3 ADP, or whether the Step 3 deliverable should be an IMWP only. Second, we noted that the estimated capital cost increased from $167k to $280K between the Step 2 and Step 3 ADPs. We can see that the amendment was changed and the dilution factor was changed, both contributing to the additional cost. The current cost estimate for bioremediation is about the same as the Step 2 ADP provided as a capital cost for air sparging. (Granted, there are construction concerns with air sparging, and cost is not the sole selection criterion for remedial approach.) Some discussion regarding the level of fidelity for Step 2 cost estimates would be helpful for us, as the newer members of KSC's Remediation Program.

We present the following specific comments for your consideration:

**IM Work Plan**

1. Section 3 – Agree with the injection locations and treatment intervals. Expanding the treatment zone where there was no 46-50 ft bls sample is a good, conservative approach.

   Please include a preliminary injection details table (understanding that this will be finalized in the implementation work plan). This table should include injection location identification, GPS coordinates of the injection location, injection depths/lifts, and volume of SRS®-SD/water solution per lift. The table should be inserted into Section 3 of the IMWP.

   *Response: A table detailing the injection details is provided in Appendix E. This table (Electron Donor Dosing and Injection Volume Calculations) provides details for the injection locations based on depth interval. The information provided includes the following: (i) treatment interval; (ii) the number of 2-foot injection lifts within this interval; and (iii) the volume of solution per lift. A table or figure providing the injection location GPS coordinates should be included in the IM Implementation Work Plan. To provide maximum flexibility to NASA for implementation, the injection details were kept generic such that the A&E/vendor implementing the project has the ability to tailor the implementation to their technical strategy/vendor equipment.*

2. Section 3 – Were any other DPT injection techniques considered in addition to the drop-tip injection method? A technique that includes active pore space dilation or that induces more pressure may reduce the overall field time and would reduce the volume of water required, while still achieving the required 8 ft ROI.

   *Response: By active pore space dilation, we are assuming this terminology is referring to fluidizing and/or fracturing the formation (dilation of pore spaces) using high flow and pressure (kinetic energy) applications. We have used this approach (as well as others) at KSC, and elsewhere in Florida, as well as the Vironex system which is the system proposed in this IMWP (note the IMWP does not require the Vironex approach). The Vironex system achieved distribution objectives at LC34 Hot Spot 1 as a delivery system; therefore, we proposed the use of the Vironex system in the IMWP.*

3. Section 3 – Does SRS®-SD contain sodium bicarbonate or is the sodium bicarbonate an addition in the field? The SRS®-SD product information provided in Appendix C does not list sodium bicarbonate as an ingredient. If it is a field addition, and given the large amounts of water contemplated, is sodium bicarbonate addition at 6-8 g/L as a buffer necessary? We assume that the make-up and chase water will have a near neutral pH.

   *Response: SRS®-SD does not normally contain sodium bicarbonate, but it will be added by the manufacturer during the manufacturing process. The addition of the sodium bicarbonate is to provide additional buffering capacity to the aquifer to reduce the pH*

*reduction that can occur as the substrate ferments while in the aquifer. There was no additional cost for the addition of sodium bicarbonate to the SRS®-SD.*

4. Section 3 – Include a section regarding proper abandonment of injection boreholes. The implementation section should also include a strategy for how injections will occur around previous completed injection locations. Proper abandonment and injection strategy is imperative in minimizing the potential of daylighting, as you know.

   *Response: The injection boreholes will be abandoned by tremie grouting the boreholes, and this information will be added to the IMWP. Information on injection strategy should be included in the IM Implementation Work Plan, since it will ultimately be dependent on the equipment/vendor utilized for the injection work.*

5. Section 4 – Overall, we agree with the location and intervals of the new performance monitoring wells. At DPT-202, 10x NADC exceedances are observed over the 21-30 ft bgs interval. TCE 1% solubility exceedances are observed over the 36-40 ft. interval. The IMWP only proposes installing a performance monitoring well at the 23-28 ft. bgs interval. Consider installing another performance monitoring well at this proposed location over the 36-40 ft. bgs interval.

   *Response: The monitoring plan was designed with a minimum number of monitoring wells to provide adequate information to evaluate the bioremediation implementation (understanding that a robust DPT groundwater sampling event would also occur). The screen interval (23 to 28 ft BLS) for proposed monitoring well MWC at location DPT0202 was selected to monitor the shallow CVOC concentrations that are greater than 10XNADC in that area. There are six other proposed monitoring wells that are screened in the interval where TCE concentrations are greater than 1% solubility (MWA, MAB, MWD, MWE, MWG and MWH). Based on the rationale provided, we do not believe that a monitoring well screened from 36 to 40 ft BLS at DPT0202 is warranted.*

6. Section 4 – All UIC sampling locations are located along the center line of the treatment area. No UIC sampling locations are located along the perimeter of the treatment area to monitor for any lateral movements that could potentially result from the groundwater injections. Consider adding MW0026 to the UIC sampling routine.

   *Response: We believe the upgradient (MW0025) and downgradient (MW0029) UIC monitoring wells are adequate to monitor if groundwater outside the injection area is impacted by the injectate.*

7. Section 4 – MW0029 is located approximately over 150 ft away from the treatment area and is screened below the treatment depths. Consider replacing MW0029 with IW0014I for UIC sampling or install a well over the 30-40 ft bgs interval west of the treatment area.

*Response: Monitoring well MW0029 is included as a UIC well to evaluate if there is migration downgradient of the injection area. The injections will occur from 14 to 50 ft BLS; therefore, the screen interval of monitoring well MW0029 (40 to 50 ft BLS) is appropriate. We do not believe the addition of monitoring well IW0014I is necessary (see response to comment #6 above).*

8. Section 4 – The majority of the performance monitoring sampling is within the treatment the SZ treatment area. Consider adding monitoring wells that are outside the treatment area to better determine the overall effectiveness of the remedial action. Propose adding MW0025 and MW0027 to monitor the 10 x NADC exceedance areas. Also, consider adding MW0026 to the performance monitoring schedule to monitor the perimeter along the SZ treatment area.

   *Response: The area outside the SZ will be monitored as part of the Interim Groundwater Monitoring (IGM) program (The IGM Plan is currently being prepared and will be presented with the next Step 1 EE). Our primary monitoring focus for this IM is to evaluate the performance of bioremediation inside the source zone. It is anticipated that DPT sampling will be performed approximately 1 to 2 years following the injection, and groundwater samples can be collected from the CVOC 10X NADC area, if deemed appropriate.*

9. Section 4 – MW0026 is located along the southern edge of the SZ treatment area. Due to its proximity to the treatment area, consider abandoning and re-installing MW0026 due to preferential pathway concerns and potential daylighting issues.

   *Response: If the injection technique proposed in the IMWP is utilized, we do not anticipate daylighting issues at monitoring well MW0026 (no daylighting issues occurred at LC34 Hot Spot 1 where we had monitoring wells [with secure caps] within 2 feet of injection locations). If an alternative injection vendor/technique is ultimately utilized, the abandonment of the well should be considered in the IM Implementation Work Plan.*

10. Section 4 – Due to preferential pathway concerns and potential daylighting issues, performance monitoring wells should be installed after groundwater injections are complete. DPT VOC concentrations can be used for baseline comparisons instead. MW0024, MW0025, and MW0026 could be used to monitor for mounding during injections.

    *Response: See response to comment #9. Proposed monitoring wells MWA, MWC, MWF, and MWH and existing monitoring wells MW0024, MW0026 and IW0014I will be monitored for mounding*

11. Section 4 – Consider sampling MWD and MWH for dissolved hydrogen gas on an annual basis during the performance monitoring sampling events.

*Response:* *Dissolved hydrogen concentrations are not necessary for the evaluation of dechlorination of CVOCs. Hydrogen is the only electron donor that Dehalococcoides (Dhc) can utilize to dechlorinate CVOCs, but other information can be used to evaluate if dechlorination is occurring. As part of this IM, CVOCs, total organic carbon (provides information about electron donor), methane, ethane, and ethene (provides information on whether complete dechlorination is occurring), and Dhc and vinyl chloride-reductase (vcrA) (provides information on organisms and genes responsible for dechlorination) will be monitored. These constituents provide more than adequate information to evaluate the progress of microbial mediated reductive dechlorination.*

12. Section 4 – If bioaugmentation is being considered as part of the remedial action, baseline sampling should include a *Dhc* census (including tceA and vcrA), at a minimum.

    *Response:* *Analysis of groundwater samples for Dhc and vcrA is proposed as part of the IM at proposed monitoring wells MWD (36 to 40 ft BLS) and MWH (26 to 30 ft BLS). The analysis for Dhc will provide information on the size of the Dhc population and the vcrA gene will provide information on the reductase gene responsible for VC to ethene dechlorination. The tceA gene is the Dhc reductase gene that is responsible for dechlorination of TCE to VC. We believe that quantifying the Dhc population and the vcrA gene provides valuable information and that quantifying the tceA gene is not necessary.*

13. Section 4 – Monitoring wells at the GSA Reclamation Yard IM were installed with a 2' x 2' x 4" concrete pad and traffic vaults. Due to the heavy equipment traffic at GSRY, several of the pads and wells were damaged. Consider installing more robust pads (3' x 3' x 6" with reinforcement, or better) in an attempt to better withstand the heavy equipment traffic that will likely be present at CRHE.

    *Response:* *Geosyntec concurs and proposes to use 2′x2′x6″ reinforced pads and the IMWP will be updated to reflect this.*

**Step 3 EE ADP**

1. General – Please discuss the substitution of SRS®-SD for EOS®, and the flow-down changes (such as dilution), plus any other factors that were notably different between Step 2 assumptions and Step 3 design. This will provide the Remediation Program with clear documentation of the reason for the change in capital cost. We do not disagree with the selection of SRS®-SD, but since EOS® was presumed to yield representative costing for whatever amendment was developed in Step 3 and there was a notable increase in cost, the reason for selection should be described.

    *Response:* *The changes between the Step 2 and the Step 3 EE included the following: (i) modification of the electron donor from EOS® to SRS®-SD; (ii) increasing the dosing of*

*the electron donor from 0.5% to 0.7%;(iii) the method of calculating the pore volume of the treatment area (considering overlap and drift outside the treatment area); and (iv) an increase in number of DPT sampling days from three to five. A description of our rationale for these modifications is provided below.*

*The decision to substitute SRS®-SD for EOS® stemmed from our experience with both products. Over the past couple of years, the EOS® products have arrived at our sites with a pH that was less than 6, which is below neutral and can influence the pH of the aquifer. SRS®-SD has a neutral pH and we have had positive results.*

*The SRS®-SD costing provided was their estimated 2015 costing ($940/drum), since NASA is anticipating this IM will not be implemented until 2015 (The estimated 2014 pricing is ~$882/drum). The cost for EOS provided in the Step 2 EE was an anticipated 2014 cost and they were not able to provide us an estimated cost for 2015. This change affected the cost because the cost of a drum of SRS®-SD is approximately $940/drum and the cost of a drum of EOS® was approximately $730/drum.*

*The decision to increase the electron donor dosing from 0.5% to 0.7% was based on comments received during the Step 2 EE that were concerned that the dosing of 0.5% was low. As stated in the IMWP, Geosyntec generally recommends a dosing of 0.5% to 1% of pore volume (with oil); therefore, the dosing was increased to 0.7%. This change affected the cost because the volume of EVO increased. The cost increase is discussed below.*

*During the Step 2 EE, the treatment volume was estimated by using the area of the SZ times the treatment interval (3,050 square feet x 30 feet). For the IMWP, since the treatment interval varied by location, the pore volume was calculated for each injection location (assuming an 8-foot radius of influence and a specific treatment interval), and then summed to provide a total treatment volume. This approach more accurately reflects the total treatment volume, since it includes the overlapping of the radius of influence (in addition to the treatment of some areas outside the specific SZ iso-contour). The change in this calculation increased the total treatment volume (from ~ 200,000 gallons to 300,000 gallons), which increased the amount of EVO solution required and increased the number of days that injections would occur.*

*The cost from the Step 2 EE and the Step 3 EE were compared based on the cost per cubic yard treated. A summary of the cost is provided below:*

- *Step 2 EE cost*
    - *~$129/cy based on total cost for 3 years ($437,000) and cubic yards treated (3,390 cy)*

- *~$164/cy based on total cost for 5 years ($557,000) and cubic yards treated (3,390 cy)*

- *Step 3 EE cost*
  - *~$145/cy based on total cost for 3 years ($626,500) and cubic yards treated (4,317 cy)*
  - *~$164/cy based on total cost for 5 years ($708,700) and cubic yards treated (4,317 cy)*

*The costs summarized above show that from the Step 2 EE to the Step 3 EE, the treatment volume has increased, but that the cost per cubic yard is similar.*

2. Slide 5 – Shows the SZ Area and 10x NADC exceedances area. Since this figure was based upon the DPT results presented in Slide 9, consider having the information on Slide 9 precede Slide 5.

   *Response: The location of this slide is to help aid in the discussion of treatment intervals and monitoring depth, the slide was not intended to be provided as background information.*

3. Figures 3-2 and 3-3 – Treatment depths on Figures 3-2 and 3-3 (slides 14 and 15) are presumably indicated by the color blocks, but there is no legend or key to that effect. Recommend adding a call-out or legend.

   *Response: A printing error caused the injection intervals to not be presented on Figures 3-2 and Figures 3-3. The figures are presented correctly in the ADP, and have been reprinted and provided to the Team.*

4. Slide 16 – Please include the assumptions used to generate the volume estimates in the chart on Slide 16 (porosity, pore space saturation, ROI, vertical thickness, etc.). We found these in Appendix E of the IMWP.

   *Response: Slide 16 is a summary of the information presented in Appendix E of the IMWP. A reference to Appendix E has been added to the slide, since the ADP and IMWP are meant to be complimentary documents.*

5. Slide 17 – Please call out the wells that will be monitored to ensure that mounding does not occur.

   *Response: Proposed monitoring wells MWA, MWC, MWF, and MWH and existing monitoring wells MW0024, MW0026 and IW0014I will be monitored for mounding. This information will be added to the IMWP.*

**Tetra Tech's Comments:**

Tetra Tech generally concurs with the information presented in the Contractor's Road Heavy Equipment Area (SMWU 055) Interim Measure Work Plan (IMWP) with the below comments. Overall, the package was well written and completed with a high level of thoroughness and was clearly presented.

**IMWP**

1. Section 1.3 – Please verify if the objective the IM is to evaluate the effectiveness of bioremediation or to treat the plume to an endpoint (e.g., NADC, transition to MNA, etc.). As currently stated, the IM objectives appear worded towards a pilot study rather than an IM.

   *Response: The IM objective is as stated in the ADP and the IMWP and is worded this way because the IM is focused on the SZ (located within a larger plume).*

2. Section 2.7 – It would be helpful in evaluating biological conditions if chloride data at the injection depth intervals is provided in this section. Overall, this section was very helpful in supporting the appropriateness of bioremediation at CRHE.

   *Response: Chloride data was not collected at this site. During the data gap sampling in December 2013, the salinity from monitoring wells MW0025 (0.77%) and MW0029 (1.5%), indicate that chloride should not affect Dhc. Additionally, ethene and ethane were detected at the site and that suggests that complete dechlorination is occurring.*

3. Section 3.1 – The inherent benefit of bioaugmenting may overweigh a "wait and see" approach. For the small capital expenditure, enhanced dechlorination may occur while biostimulation conditions are at their best and the appropriate microbial populations are present. We suggest adding the proposed KB-1 into the initial injection design to account for any uncertainty with the dechlorination potential of the indigenous populations. Alternately, microcosm testing prior to implementation of the IM may be beneficial to confirm full dechlorination and kinetics with the indigenous populations versus KB-1 bioaugmentation.

   *Response: Based upon our sampling results (presence of ethene and ethane and presence of Dhc and vcrA), we do not believe microcosm testing is necessary, since the results indicate that complete reductive dechlorination is occurring. We agree that bioaugmentation would be beneficial, but is not necessary. We propose that the decision to bioaugment be made based on the baseline sampling results. Groundwater samples will be analyzed for Dhc and vcrA from two proposed monitoring wells and if the Dhc and vcrA concentration is less than $10^6$ gene copies per liter, bioaugmentation will be performed.*

4. Section 3.2 – It is our understanding that SRS-B contains ingredients for aquifer buffering (based on Terra Systems' website). Please confirm if sodium bicarbonate is in the costed product (SRS-SD) or if a custom formulation was derived for CRHE. Will any additives result in secondary UIC issues (e.g., addition of sodium bicarbonate forming sodium salts)?

   *Response: There was no additional cost for adding sodium bicarbonate to the SDS®-SD. SRS®-B is formulated for low pH aquifers and has 5 to 15% buffer. Per the FDEP Acceptance Letter provided in Appendix D of the IMWP, UIC monitoring associated with the injection of SRS®-SD requires monitoring of sodium, total dissolved solids, and total recoverable petroleum hydrocarbons. Since the UIC monitoring includes sodium, there should be no secondary UIC issues. Also, by approximating the resulting concentration of sodium in the 305,000 gallons of pore volume, the concentration of sodium in the aquifer due to the addition to 8 g/L of sodium bicarbonate to the SRS®-SD is less than 0.03 g/L, and the KSC Upper Range of Background for sodium is 15 g/L (FDEP GCTL is 0.16 g/L).*

5. Section 3.3.1 – Since specific vendor and subcontractors cannot be selected at a design stage and contracting mechanisms require competitive bidding, please include "or approved equivalent" or similar language when specifying products and services.

   *Response: We assume this comment is referring to the following sentence:*

   *"The SRS®-SD amendment will be injected into the subsurface by a DPT injection subcontractor (worked scoped assumed the use of Vironex, Inc.)"*

   *We intended the above language in the text to allow for the use of any vendor (which was the intent). The text above was meant to provide information on how we costed and scoped the work. The text will be modified to also include the "or approved equivalent" language.*

   Section 3.3.1 – Please include a table/calculation (with figure referencing locations) showing the injection criteria and assumptions for each injection point. This would include information such as coordinates, treatment interval, groundwater volume, dosage concentration, substrate volume, chase water volume, lift length, lifts per boring, substrate and chase volume per lift, etc.

   *Response: See response to Jacobs's IMWP comment # 1.*

6. Section 3.3.3 – Were costs and time required for conditioning dilution and chase water included in the design? For example, how many and what size tanks will be required and how much dechlorinator and oxygen scavenger will be required.

*Response:* *Yes, time was considered; however, it is minimal when using the sodium sulfite as presented in the IMWP. The number and size of tanks is an Implementation Work Plan Detail.*

*Note that for the evaluation in the IMWP, the mixing was based upon the vendor using 250-gal mixing tanks as described in Section 3.3.3. As described in Section 3.3.3 of the IMWP, 0.24 g/gal of sodium sulfite would be added (calculations included in Appendix E). The amount of dechlorinator added would change based on product (or natural conditioning may be feasible).*

7. Section 3.3.3 – The text indicates that injection activities will occur at up to 10 locations, simultaneously. Can more information be provided to detail the specific approach for injections (i.e.: injection point sequencing, etc.)?

   *Response:* *Based on information provided by Vironex, they will provide the equipment to allow the injections to occur at up to 10 locations simultaneously. We believe it is best to determine the injection point sequencing in the field, since the number of locations that can be injected into simultaneously will be dependent on how the formation accepts the injectate, proximity to previously abandoned locations, etc.*

8. Figure 3-2/3-3 – It is not clear what this figure is presenting, as injection locations and intervals are not depicted. Please revise showing applicable injection locations and treatment interval within the cross section. See Slides 14 and 15 of the Step 3 EE.

   *Response:* *See response to Jacobs's IMWP comment #3.*

9. Section 5 – It is our understanding that the Step 4B EE may not be a requirement for future IMs. We suggest Geosyntec discuss with the RPM whether to retain the Step 4 B EE.

   *Response:* *After discussion with the RPM, the Step 4B will be removed from the IMWP and the costing.*

10. Section 6.3 – Information relating to a secondary injection event is not provided in detail. Since there is potential for a secondary injection event, please provide additional information.

    *Response:* *The details of a second injection event would be based on the results from the performance monitoring and the DPT groundwater sampling event; therefore, it the details of a second injection event have not been included in this IMWP.*

11. Section 6.3 – If a secondary injection event is required, the monitoring duration would most likely extend to at least 5 years (i.e., ~2-3 years first injection, 2+ years second injection, 1+ years post-remediation monitoring). Please confirm monitoring durations.

*Response: The monitoring duration is dependent on whether there is a second injection event and the results from the performance monitoring; therefore, the monitoring duration was not stated. Costs are included for monitoring up to 5 years to be conservative.*

12. Table 6-1 – The IMWP costs for bioremediation are approximately $80,000 higher than the highest-range costs for air sparging. Please add a slide refreshing the screening criteria between bioremediation and air sparging to validate proceeding with bioremediation in reference to the updated costs completed in the Step 3 EE. We acknowledge that bioremediation is preferred, since site interferences are decreased.

    *Response: The cost details are provided in the response to Jacobs's ADP comment #1.*

    *The technology evaluation summary from the Step 2 EE is provided below.*

    - *Why not air sparging?*
        - *Trenching at an active facility with large pieces of equipment and personnel that work in the area*
        - *Heavy equipment will likely require specialty vault boxes and geotech evaluation for trenching*
        - *Likely mounding from AS and possible entrainment issue with SVE*
        - *Scale up/expansion issues (when looking at plume as a whole) – due to presence of road/railroad yard and woods/wetland*
        - *Engineering solutions can be developed, but there are risks*
    - *Why Bioremediation?*
        - *Passive implementation*
        - *Ideal geochemistry*
        - *Reduced O&M&M (monitoring only)*
        - *Amenable to scaling*
        - *More cost effective than EZVI*

13. Appendix E – Please provide entire calculation, as the provided hard copy calculation could not be reviewed since it only shows the outputs and inputs, assumptions, and calculations are not provided. Note that a CD was not received to check if this information was to be provided electronically.

    *Response: Appendix E provides the assumptions and calculations (the equations used in all the calculations are in the heading of each column) for each step for the Electron Donor Dosing and the ROI calculations. The substrate estimating tool was produced by*

*ESTCP. The EE step process does not require that source files for all calculations, models, etc. be provided on a CD for review.*

**Step 3 EE**

The following comments for the Step 3 EE ADP are in addition to those commented on the IMWP above:

1. Slide 7 – Please see IMWP comment regarding to IM objectives.

   *Response: See response to Tetra Tech IMWP comment #1.*

2. Slide 11 – Suggest numbering DPT points and providing a reference injection calculation (See IMWP table)

   *Response: The DPT injection locations can be numbered as part of the IM Implementation Work Plan.*

3. Slide 14/15 – Figures 3-2 and 3-3 do not match these figures. Please revise, as commented in IMWP.

   *Response: See response to Jacob's ADP comment #3.*

4. Slide 25 – Based on site conditions and remedy assumptions, how long does Geosyntec anticipate monitoring most likely to be required (i.e., which implementation cost is most likely)? A second injection event is fairly typical as a polishing step and may be logically required, making the interim measure a 5+ year option realistic.

   *Response: Monitoring of the passive IM is anticipated to be 3 to 5 years. Additional monitoring of the area will likely be required and those costs are not included in this IMWP.*

**General Comments**

1. Per IMWP/Step 3 EE requirements, please provide a P&ID for bioremediation equipment (in this case, a PFD would be appropriate). Please also provide details for injection point manifolding and details relating to how each point will be lifted following injection at the multiple locations (stated at up to 10 injections simultaneously).

   *Response: P&ID and PFDs for bioremediation using DPT are vendor specific. Exact details about injection lifting and manifolding will be provided in the implementation work plan when a vendor is selected by the A&E implementing the project. We do not believe that providing details regarding how each injection point will be manifolded and how each point will be lifted following injection provides the level of flexibility desired*

*by NASA. The referenced information should be included in the implementation work plan.*

2. Since CRHE is an active facility, it may be appropriate to provide a site layout/staging plan to provide locations where substrate, equipment, and tank staging are planned to be placed.

   *<u>Response:</u> We concur and believe this should be provided in the implementation work plan.*

# APPENDIX F

# STEP 1 FOR HS2, HCP and LCP ENGINEERING EVALUATION ADP (electronic copy only)

# Contractor's Road Heavy Equipment (CRHE) Area (SWMU055)

## Step 1 Engineering Evaluation

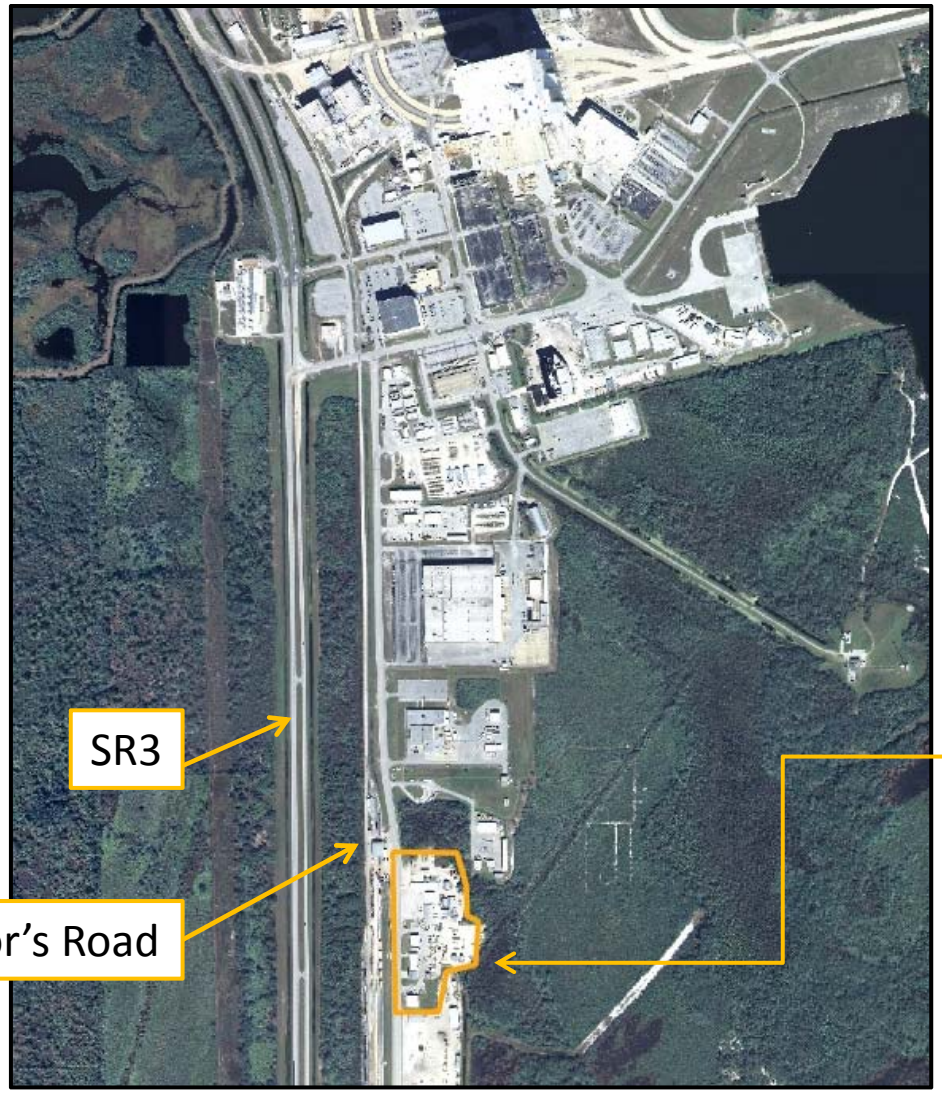
April 2015

# Objectives of Today's Presentation

- Present Step 1A & 1B Engineering Evaluation for
  - Hot Spot 2 (HS2),
  - Low Concentration Plume (LCP),
  - High Concentration Plume (HCP), and
  - Interim Groundwater Monitoring Plan (Section 1C).
- Obtain team consensus on horizontal and vertical delineation for HS2, HCP, and LCP.
- Obtain team consensus on technologies retained for Step 2 evaluation.
- Present the interim groundwater monitoring plan (IGWMP).

Geosyntec consultants

# Site Location



# Site Overview

- Numerous buildings and support structures on eastern portion of site
- Utility corridor adjacent to Contractor's Rd
- RR tracks, wetlands, and heavy vegetation in HS2
- Kennedy Parkway (SR3) borders site to the west

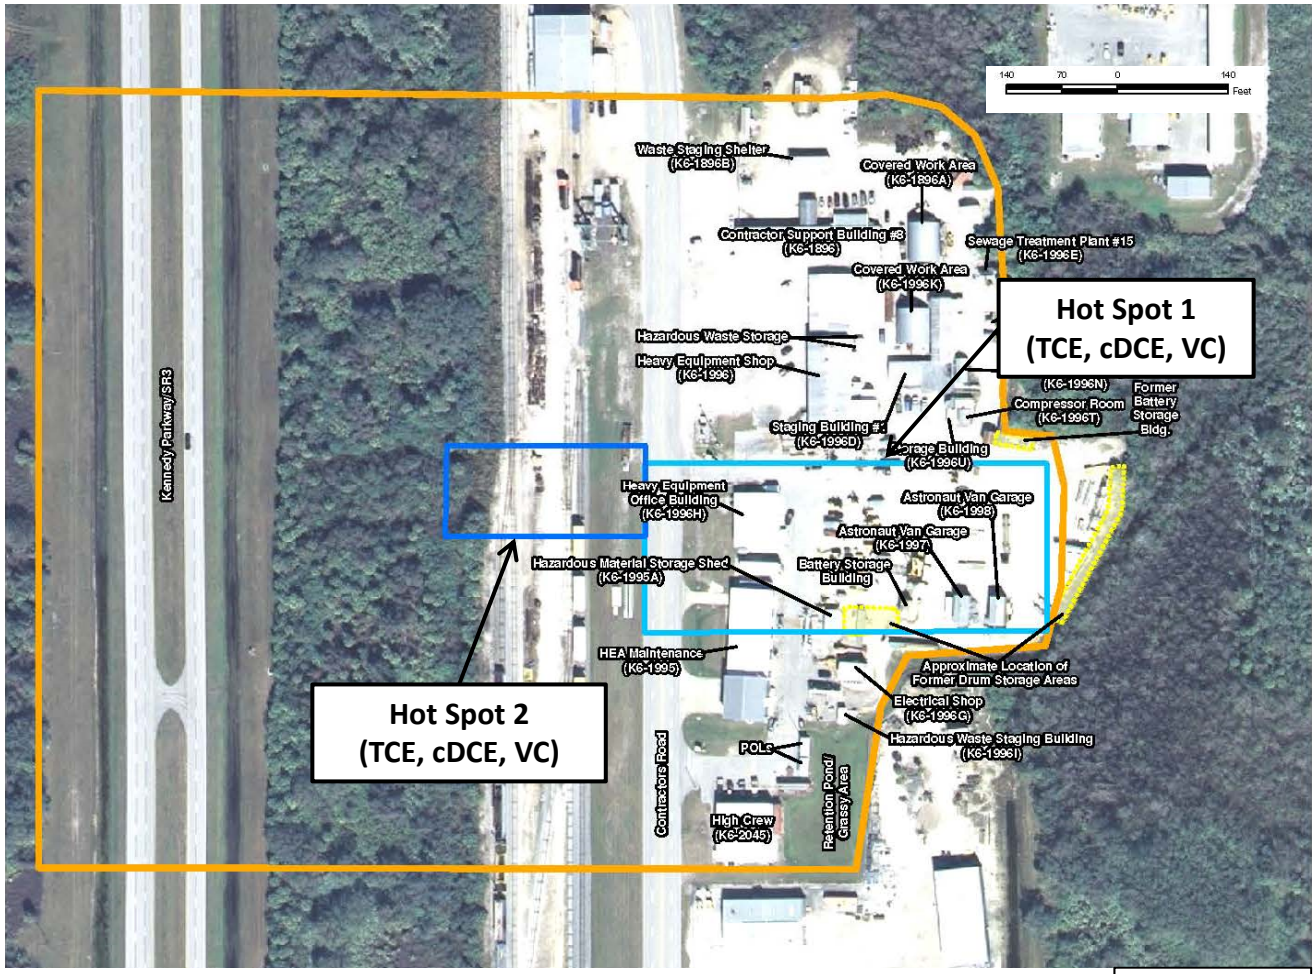


Figure 1

# Site History

- Overall site features:
  - About 23 acres
  - Paved portions
  - Majority of site is gravel and dense woods
  - Many underground utilities
  - Thick road base in some areas to support heavy equipment
- Historical site use:
  - Hazardous Waste Storage/Staging
  - Printed Circuit Board Manufacturing
  - Domestic Wastewater Treatment
  - Heavy Equipment Maintenance/Storage (historical and current use)

*Photograph of heavy equipment storage at CRHE; view facing south from the Contractor's Road entrance driveway, with Heavy Equipment Office Building (K6-1996H) shown on far right.*

# Assessment Background

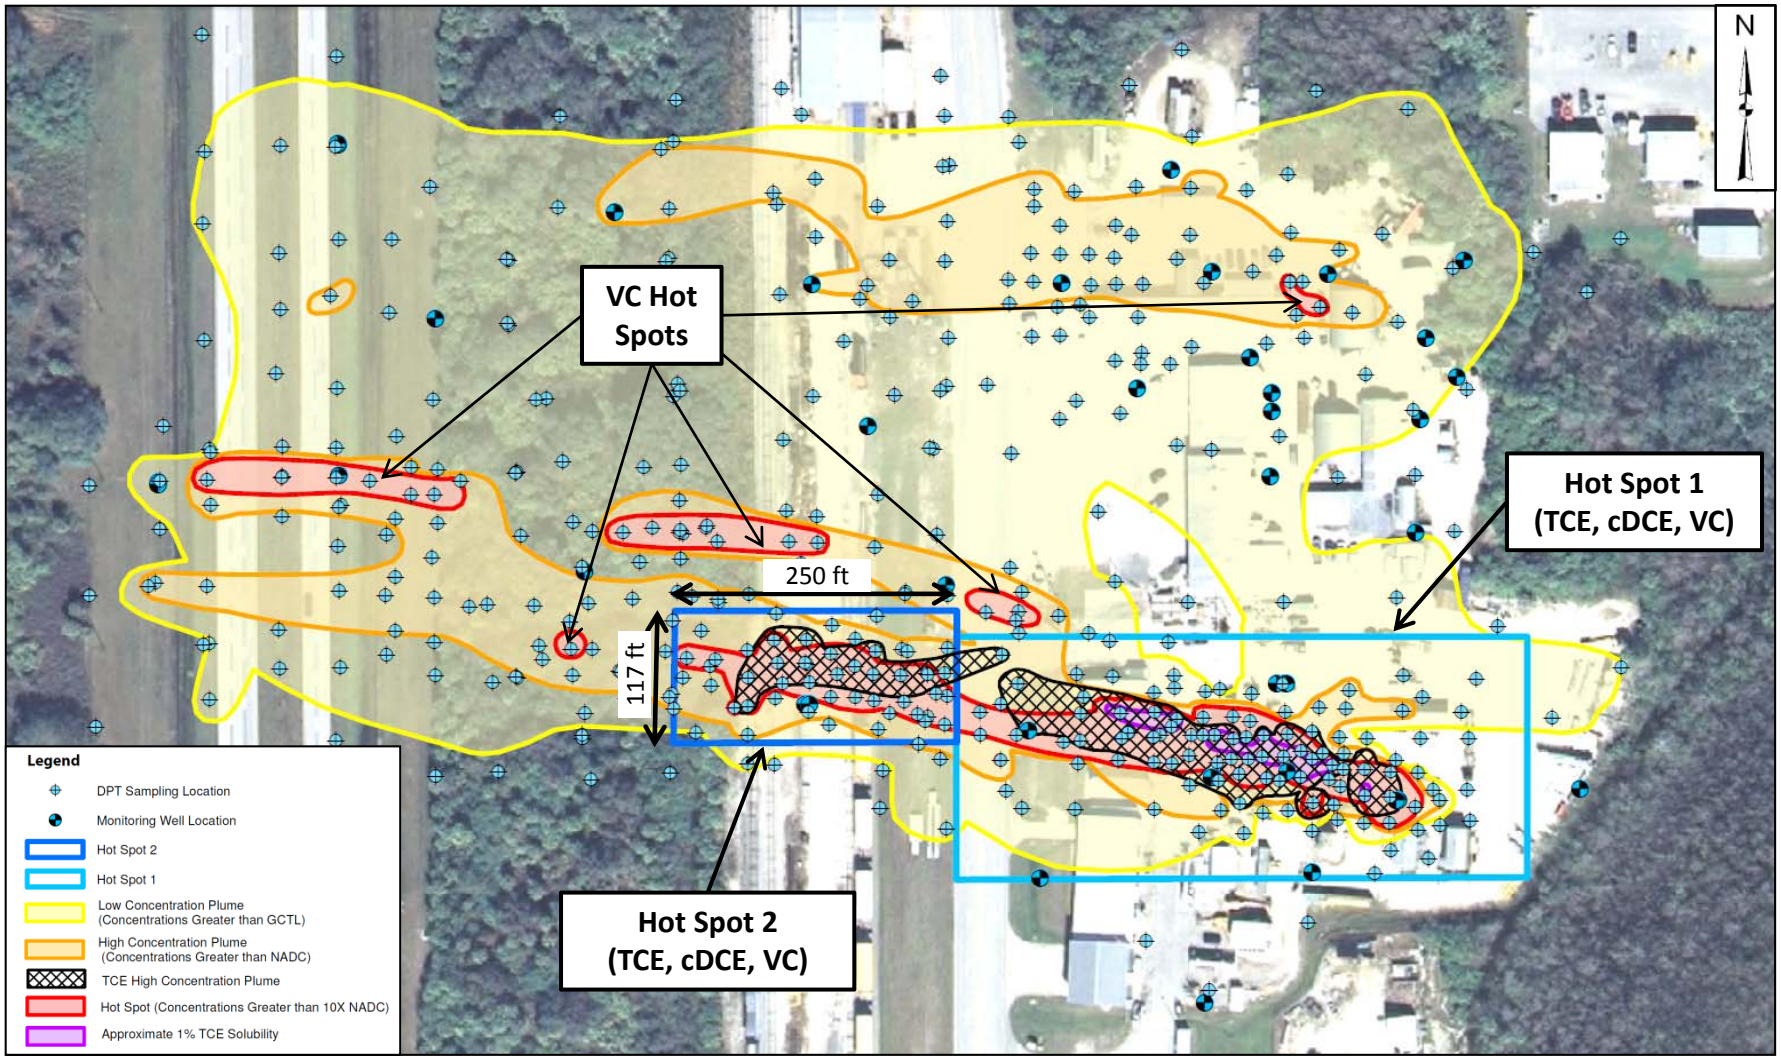
- 1994: Preliminary assessment (EG&G, Inc.)
  - Identified CVOCs and metals in GW
  - Recommended additional assessment
- 1997-1999: RFI (HSW, Inc.)
  - Identified CVOCs and metals in GW
  - VC up to 370 µg/L in northern area (waterloo profiler)
  - TCE up to 41 µg/L (in IW-4I); 0.4 µg/L by end of RFI activities
  - Highest concentrations between about 15 and 45 ft BLS
- 2000: Corrective Measures Study (CMS) (HSW, Inc.)
  - Site clean up goals established for industrial setting
  - LUCIP for GW
  - No active corrective measures recommended
  - LTM program to monitor natural attenuation of CVOCs in GW
  - 10 year estimated timeframe to reach cleanup goals

# Assessment Background

- 2000 – 2005: Semi-annual GW sampling in 7 wells
- 2005 – 2009: Site incorporated into VAB LTM program
- 2010 May: Team approved discontinuing LTM program at the Site until assessment is complete
- 2009 – 2014: Supplemental Site Assessment
- 2013 Dec: HS1 Step 1 approved
- 2014 Feb: HS1 Step 2 approved
- 2014 May: HS1 Step 3 approved

Geosyntec consultants

# Overall Site and Identification of Hot Spots



# Review of HS1

- HS1 features
  - About 3 acres
  - Paved and gravel areas
  - Buildings
  - Underground utility corridor east of Contractor's Road
  - Thick road base in northern part of HS1
  - Heavy equipment (up to 300,000 lbs) transported and stored in the area
  - Overall 10xNADC Plume runs beneath K6-1996H and Contractor's Road

# Review of HS1

- HS1 Step 1 EE – December 2013
- Impacts generally from 8 to 50 ft BLS
- MIP001 installed in HS1 – February 2010
  - Results consistent with DPT groundwater concentrations
- Max concentrations (µg/L)
  - TCE = 160,000 (DPT72, 36 to 40 ft BLS)
  - cDCE = 110,000 (DPT200, 26 to 30 ft BLS)
  - VC = 19,000 (DPT200, 31 to 35 ft BLS)
- SZ contaminant mass is mainly 30 to 46 ft BLS (60%)
- Lithology
  - primarily sand until ~40 to 45 ft BLS
  - below ~ 40 to 45 ft BLS, lithology is silty sand, with varying amounts of clay (semi-confining layer)
- Vertical delineation in source zone confirmed with monitoring well – MW0040

# Review of HS1

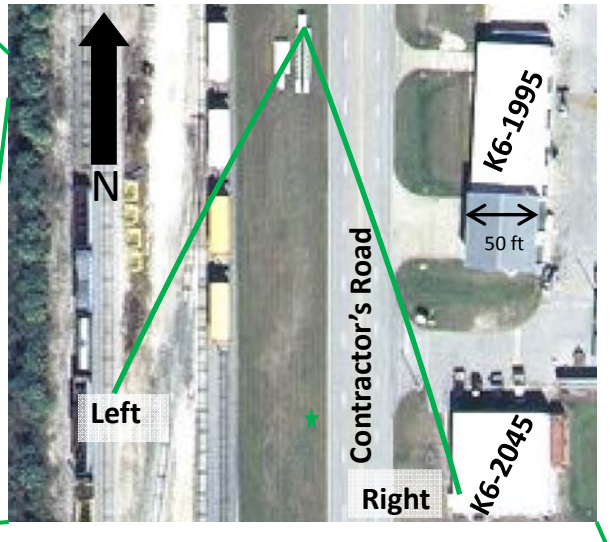
- Team consensus for HS1 Step 1
  - Delineation complete for:
    - SZ (TCE greater than 11,000 µg/L)
    - Hot Spot (TCE and cDCE greater than 10xNADC)
    - HCP (concentration of TCE greater than NADC)
    - LCP (concentration of TCE greater than GCTL)
  - cDCE HCP and LCP are co-mingled with adjacent HS areas; delineation within HS1 is complete
  - VC Hot Spot, HCP and LCP are co-mingled with adjacent HS areas; delineation within HS1 is complete
- Recommended evaluation of bioremediation, emulsified zero valent iron (EZVI), and air sparge/soil vapor extraction (AS/SVE)
- Team Consensus for HS1 Step 2
  - Move forward with design for bioremediation within SZ
- Team Consensus for HS1 Step 3
  - Bioremediation design within SZ (injection of emulsified vegetable oil)

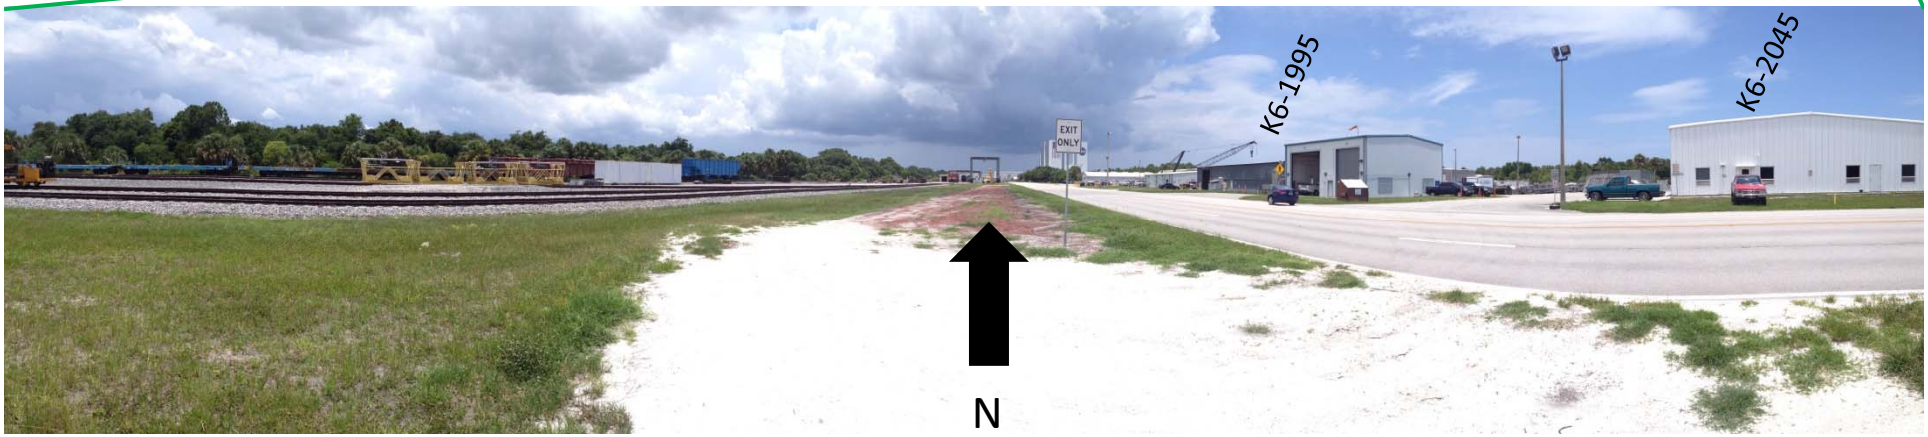
TetraTech Comment #1: Slide 12 (new Slide 13) – Suggest showing the site conditions for the HS2 area, as photos show conditions of HS1.

*Response: Comment noted; pictures of HS2 included.*

# Site Conditions

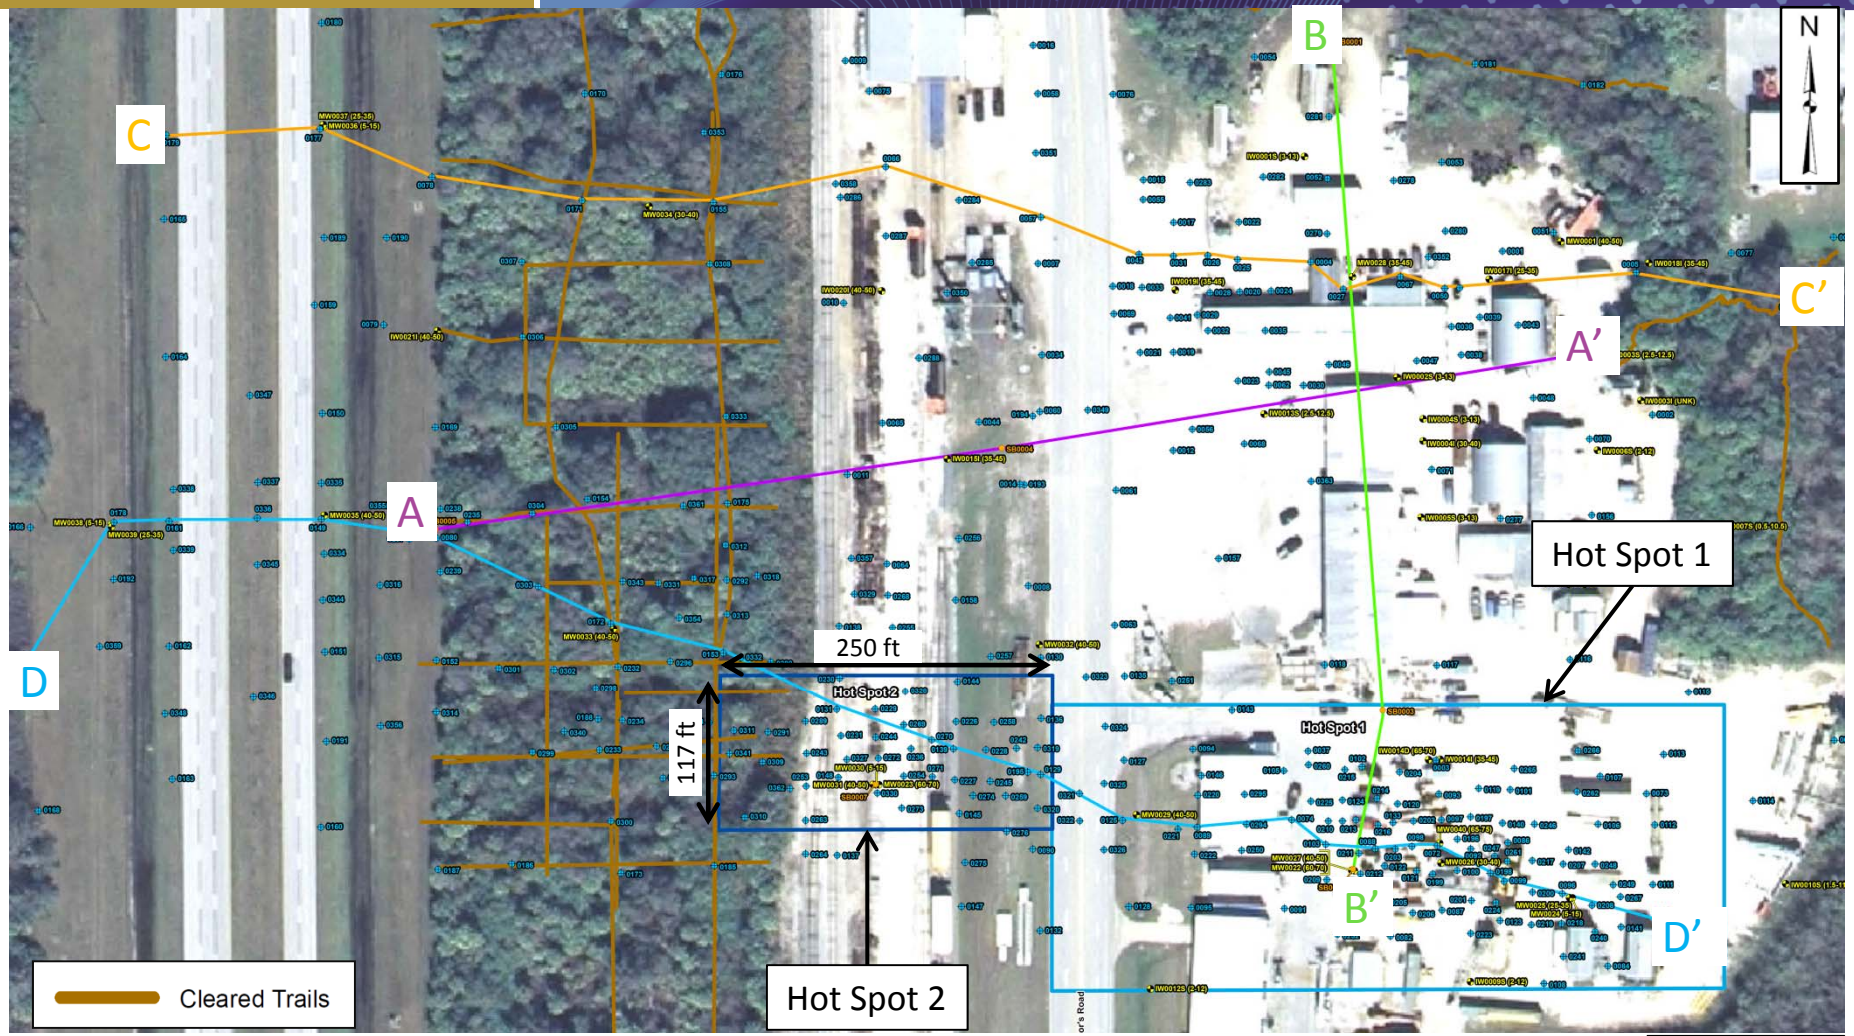
- Lithology
- Hydrogeologic characteristics





Geosyntec consultants

# Lithologic Cross Section Location Map



Note: Cross sections A to A' and B to B' display lithology only; cross sections C to C' and D to D' display subsurface plume profiles.

Figure 2

# Response to Comment

TetraTech Comment #2: Slide 14 (new Slide 16) - Is the lithologic unit present from approximately 48 to 78 feet bls a continuous silty sand with clay unit? Suggest showing any details that may relate to confining/semi-confining conditions, as a relatively thin unit with higher clay content is typically present where the top of this layer is depicted (global to cross sections).

*Response: Comment noted; see revised cross section notes.*

# Lithology A to A'

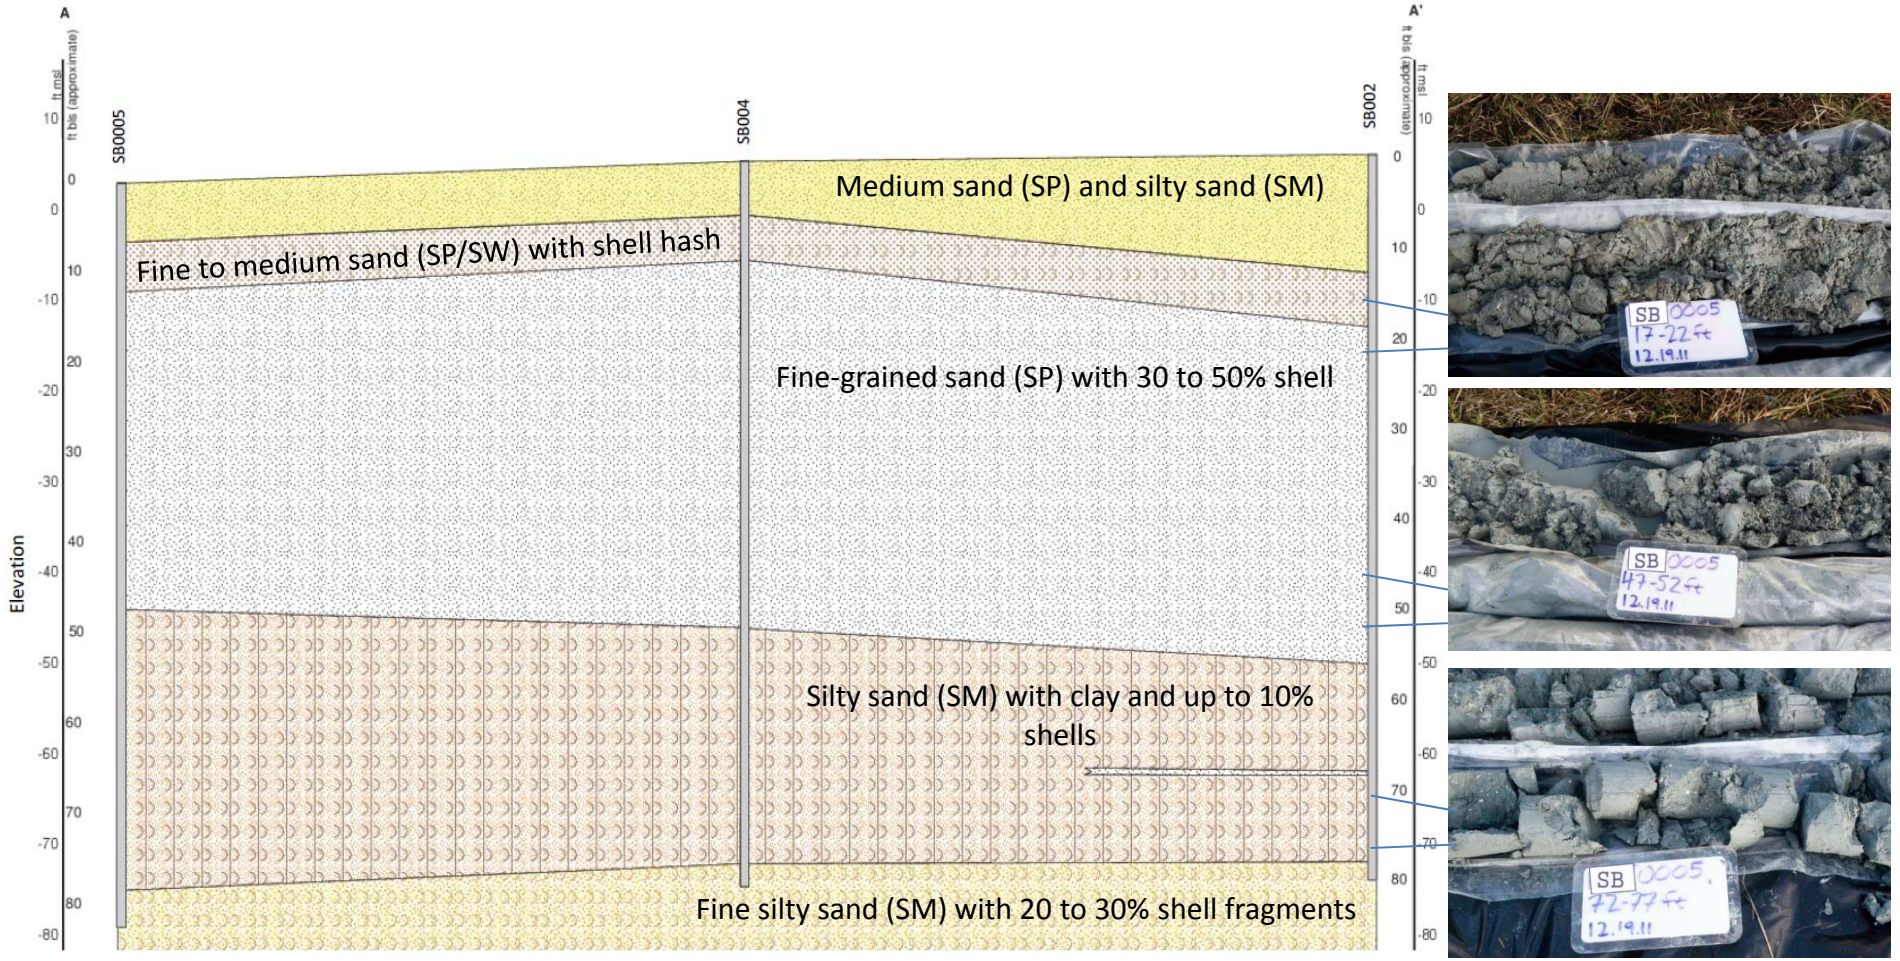


Figure 3

# Lithology B to B'

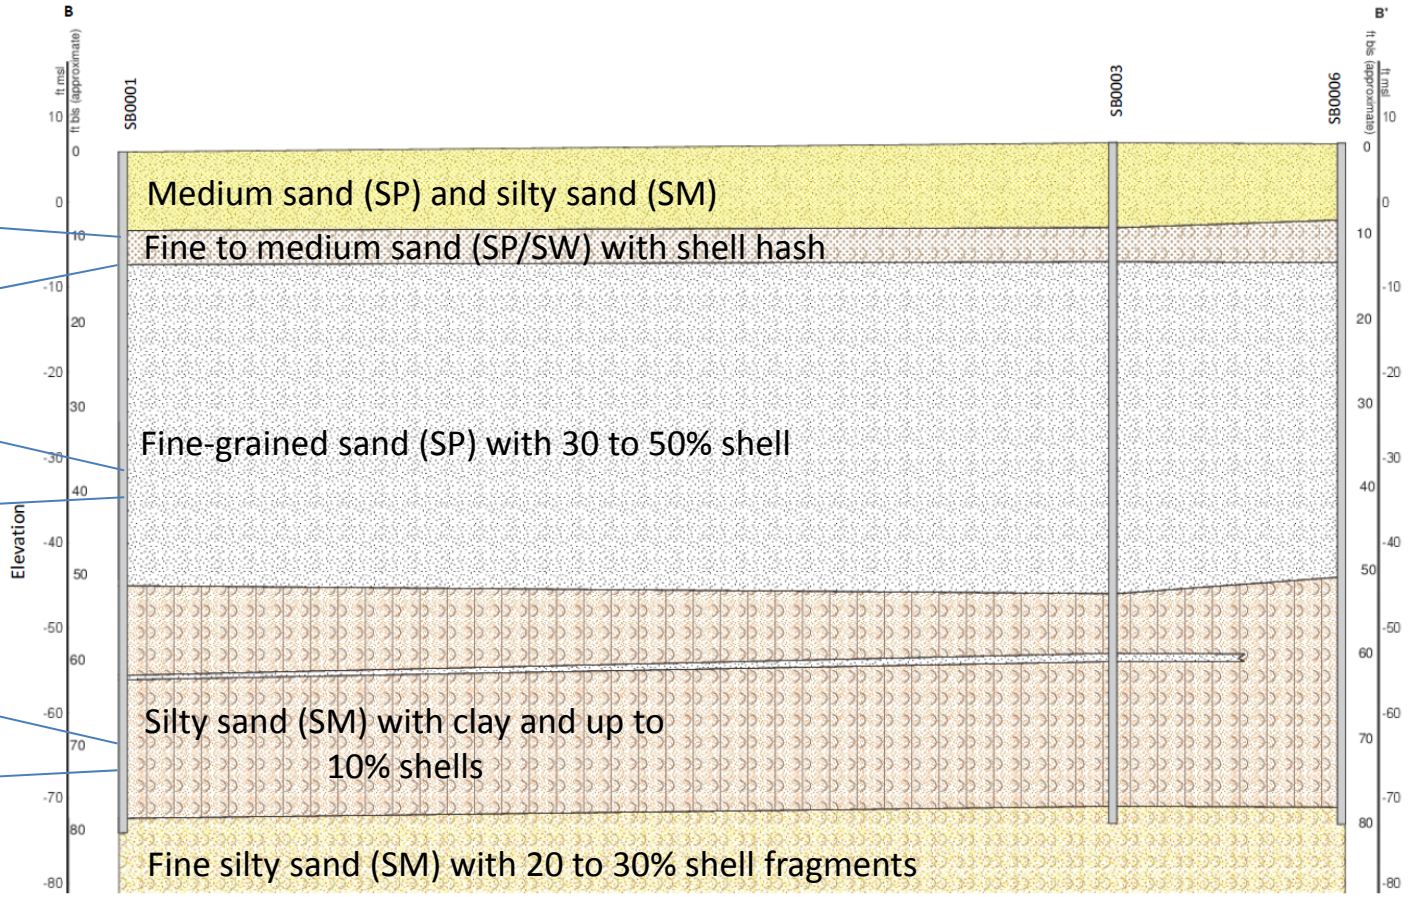

Figure 4

# Hydrogeologic Characteristics

- General groundwater flow direction
  - Shallow: west
  - Intermediate: west
  - Deep: southeast (March 2012) and southwest (July 2013)
- Depth to groundwater 2 to 6 ft BLS
- K of 7.6 ft/d (2,774 ft/yr) from specific capacity tests on shallow and intermediate wells during RFI

| GW Zone | Approx. Depth (ft, BLS) | Av Gradient (ft/ft) | Est. GW Flow Velocity (ft/y)* |
|---|---|---|---|
| Shallow | <15 | 0.002 | 28 ft/y** |
| Intermediate | 15 to 55 | 0.005 | 69 ft/y** |
| Deep | >60 | 0.002 | -- |

*Based on an assumed effective porosity of 0.2.

**Actual groundwater flow velocity is likely highly variable with higher K plume transport intervals and lower K mass storage intervals.

# Current Monitoring Well Network

- 9 shallow (<15 ft BLS) (yellow)
- 21 intermediate (25 to 50 ft BLS) (blue)
- 4 deep wells (>60 ft BLS) (orange)

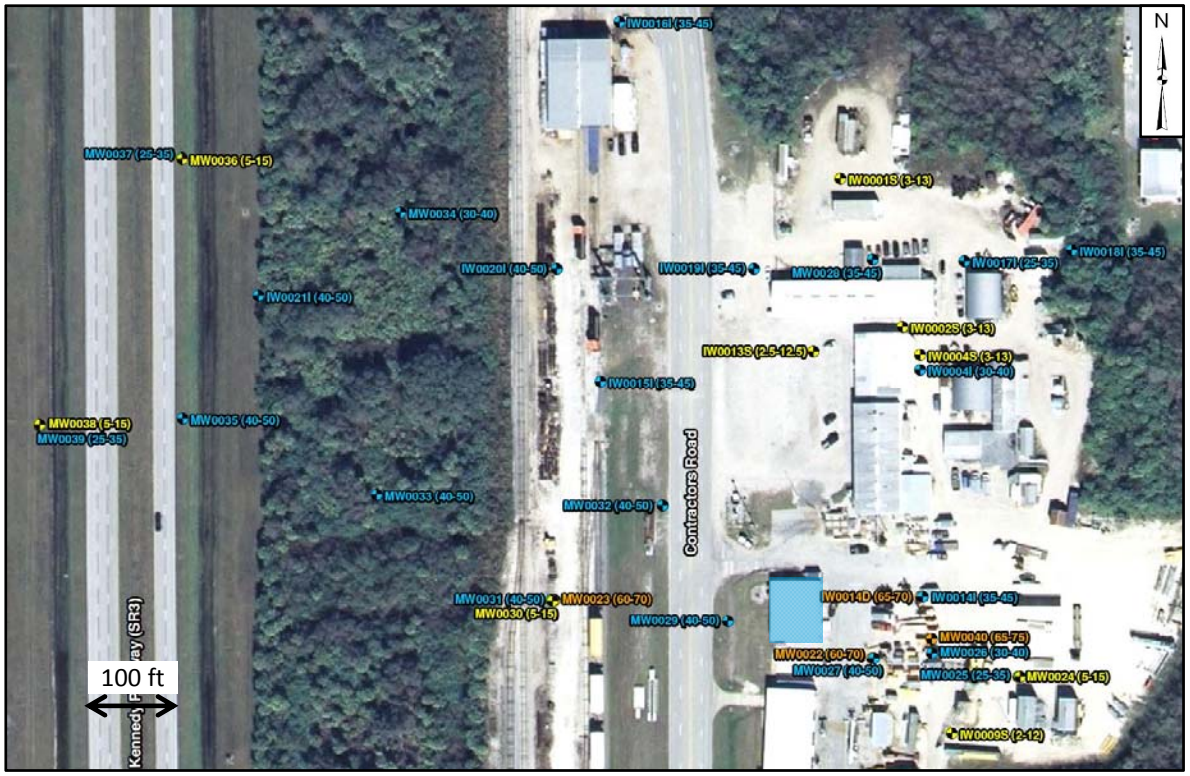

Figure 5

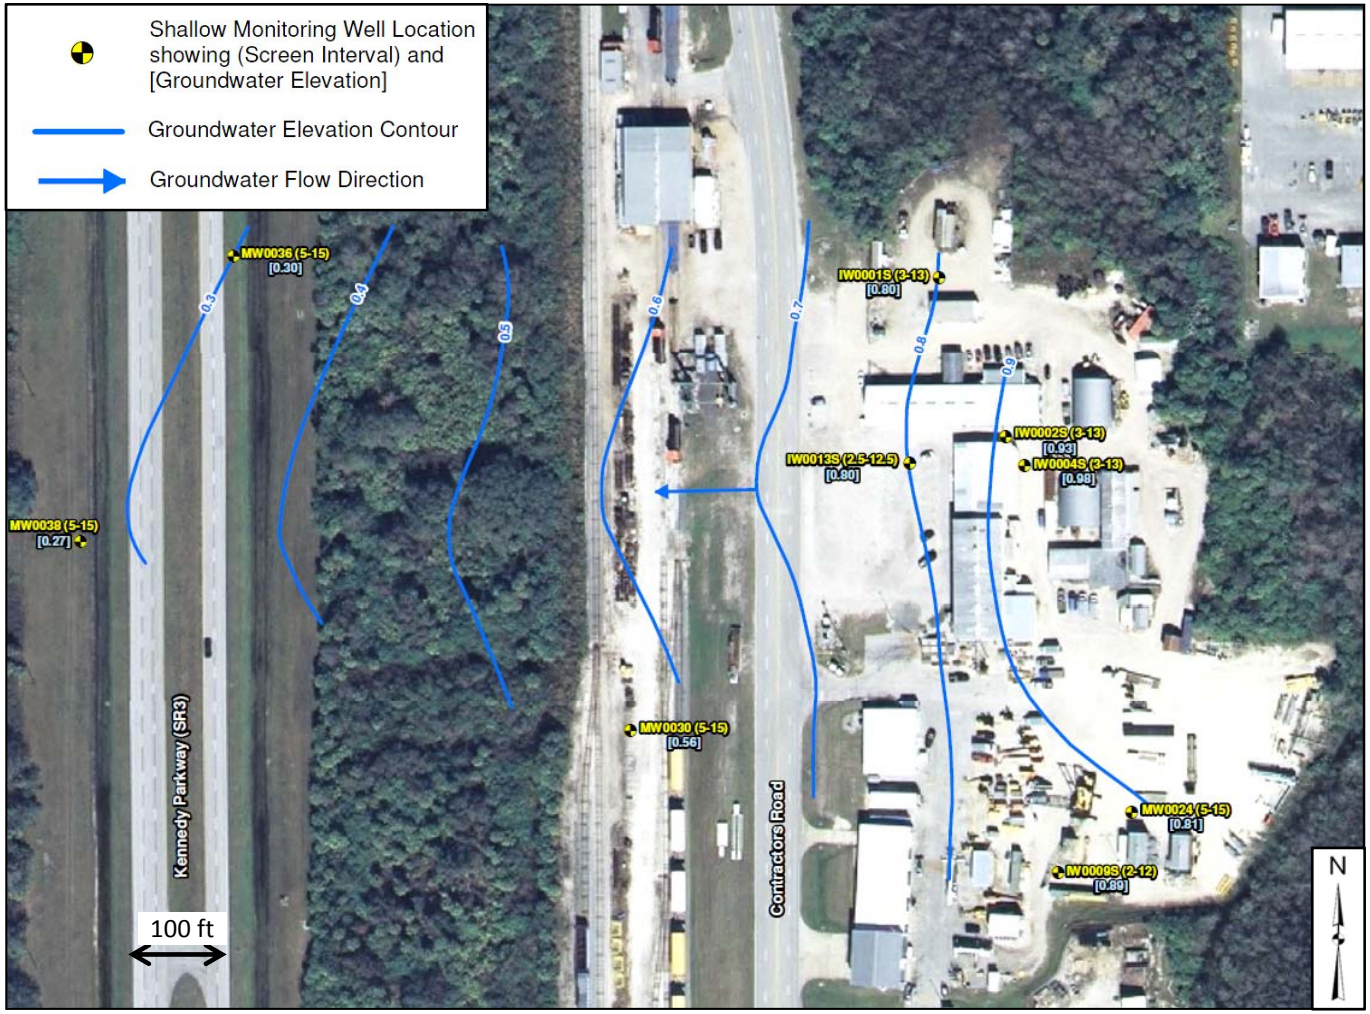
# Shallow GW Flow – March 2012



Note:

1. Screen interval is presented in feet, below land surface (ft, BLS).
2. Groundwater elevation is presented in ft and is referenced to the North American Datum of 1988.

Figure 6

# Intermediate GW Flow – March 2012

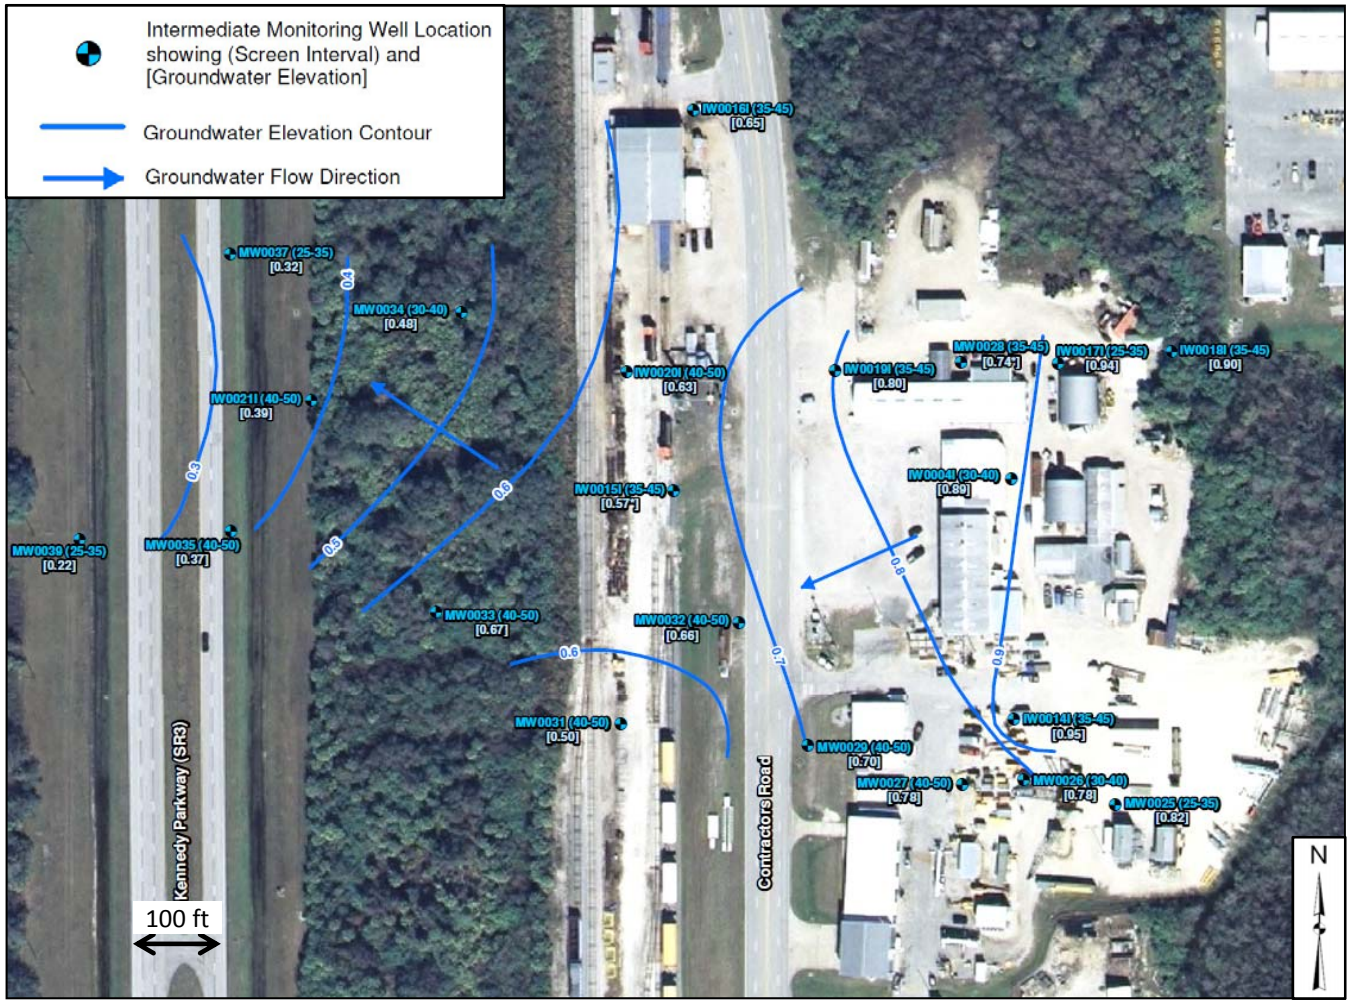


Figure 7

Note:

1. Screen interval is presented in feet, below land surface (ft, BLS).
2. Groundwater elevation is presented in ft and is referenced to the North American Datum of 1988.

# Deep GW Flow

March 2012

July 2013

Note:

1. Screen interval is presented in feet, below land surface (ft, BLS).
2. Groundwater elevation is presented in ft and is referenced to the North American Datum of 1988.
3. MW0040 was installed in July 2013.

Figure 8

# Monitor Well Sampling

- Site-wide groundwater sampling event completed in March 2012
  - 24 monitor wells sampled
  - Detected concentration ranges:
    - TCE: 0.6 I to 1,000 µg/L in 8 wells
    - cDCE: 0.44 I to 9,700 µg/L in 19 wells
    - VC: 13 to 7,600 µg/L in 17 wells
- HS1 focused sampling and gauging event in July 2013
  - MW0040 sampled
  - 17 wells gauged
- Data gap event sampling in December 2013
  - MW0025; MW0035; MW0029; and IW0019I
  - VOCs, 1,4-dioxane, methane, ethane, ethene, sulfate, sulfide, DHc, and vcrA

# Summary of Assessment Activities

- DPT groundwater sampling performed
  - May & July 2006
  - June, July, & August 2009
  - January to March, June, August, & October 2010
  - October 2011
  - January, February, & October 2012
  - March to April & May to June 2013
  - May to June, August, September, & November 2014
- 2,338 samples from 363 DPT locations
  - Generally sampled from 16 to 60 ft BLS at 4 ft intervals
  - Some sampling to 70 ft BLS for vertical delineation

# Assessment Activities - 2014

- Activities completed since Step 1 HS1 include:
  - 781 DPT groundwater samples from 97 locations
  - Data gap sampling
  - Implemented MOT plan for sample collection along Kennedy Pkwy and Contractors Rd
  - Land clearing East of Kennedy Pkwy for delineation of HS2

# Maximum Site-Wide COC Concentrations

| Depth Interval (ft BLS) | Maximum TCE Concentration in µg/L (DPT#) | Maximum cDCE Concentration in µg/L (DPT#) | Maximum VC Concentration in µg/L (DPT#) |
|---|---|---|---|
| 8 to 12 | 79 (0207) | 1,000 (0086) | 560 (0086) |
| 12 to 16 | ND | 3,300 (0086) | 1,500 (0097) |
| 16 to 20 | 9,400 (0201) | 22,000 (0092) | 2,600 (0092) |
| 21 to 28 | 7,700 (0196, 0217) | 68,000 (0217) | 6,400 (0214) |
| 26 to 30 | 13,000 (0200) | 110,000 (0200) | 8,000 (0196) |
| 31 to 35 | 21,000 (0100) | 58,000 (0200) | 19,000 (0200) |
| 34 to 40 | 160,000 (0072) | 59,000 (0100) | 17,000 (0100) |
| 41 to 46 | 19,000 (0247) | 15,000 (0196, 0216, 0247) | 4,800 (0089) |
| 46 to 50 | 3,400 (0139) | 8,100 (0228) | 2,500 (0271) |
| 51 to 55 | 1,200 (0139) | 1,600 (0139) | 380 (0330) |
| 56 to 60 | 1,400 (0217) | 6,000 (0217) | 270 (0362) |
| 61 to 65 | 43.8 (0072) | 140 (0020) | 120 (0020) |
| 66 to 70 | 33 (0196) | 84 (0196) | 1.6 (0213) |
| 67 to 71 | ND | ND | ND |
| 71 to 75 | ND | ND | ND |

- Highest detected concentrations are highlighted orange

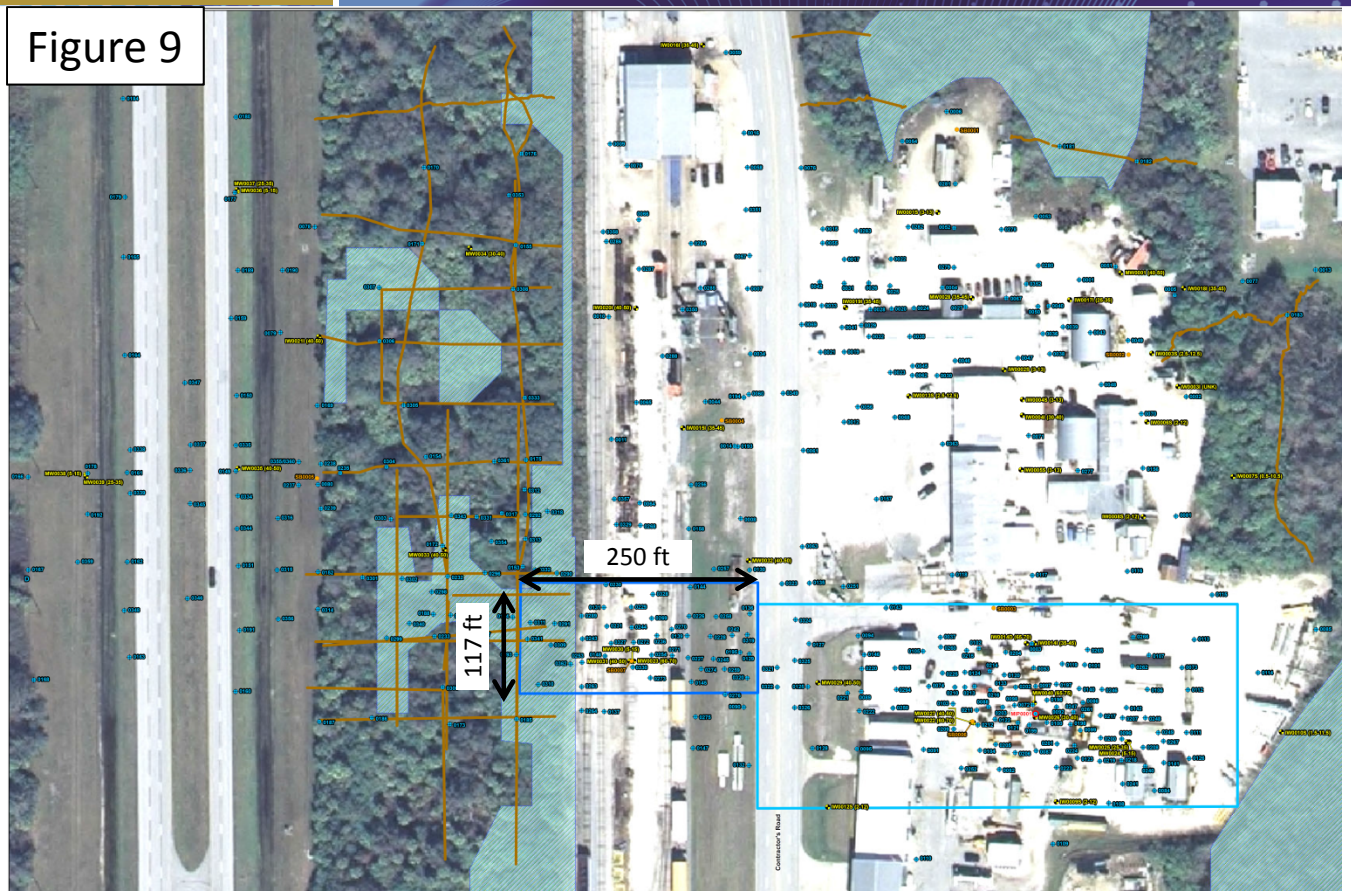
# Maximum COC Concentrations- Not Including HS1

| Depth Interval (ft BLS) | Maximum TCE Concentration in µg/L (DPT) | Maximum cDCE Concentration in µg/L (DPT) | Maximum VC Concentration in µg/L (DPT) |
|---|---|---|---|
| 8 to 12 | 3.5 (0231) | 26 (0226) | 1.2 (0226, 0289) |
| 12 to 16 | ND | ND | 1.5 (0177) |
| 16 to 20 | 1.5 (0230) | 3.0 (0135) | 65.0 (0020) |
| 21 to 28 | 2.3 (0227) | 1.4 (0256) | 53.6 (0159) |
| 26 to 30 | 6.1 (0228) | 48.2 (0039) | 1,500 (0336) |
| 31 to 35 | 22 (0174) | 1,600 (0174) | 2,400 (0336) |
| 34 to 40 | 83 I (0233) | 5,700 (0269) | 2,500 (0135, 0329, 0331) |
| 41 to 46 | 1,200 (0269) | 9,900 (0231) | 4,500 (0271) |
| 46 to 50 | 3,400 (0139) | 8,100 (0228) | 2,500 (0271) |
| 51 to 55 | 1,200 (0139) | 1,600 (0139) | 380 (0330) |
| 56 to 60 | 11 (0244) | 300 (0362) | 270 (0362) |
| 61 to 65 | 1.9 (0131) | 140 (0020) | 120 (0020) |
| 66 to 70 | 1.0 (0242) | 7.4 (0244) | 0.58 I (0244) |
| 67 to 71 | ND | ND | ND |
| 71 to 75 | ND | ND | ND |

- Highest detected concentrations are highlighted orange
- Maximum TCE concentration in HS2 is two orders of magnitude less than HS1 maximum TCE concentration
- Potentially represents historical dissolved flux from HS1

# DPT Sampling Locations

Figure 9



Notes:

1. Tag maps included as Figures 10, 11, 12, and 13 (not included in presentation).
2. Blue shaded areas are generally submerged.
3. Table 1 (attached) provides additional explanation where sample spacing varied from suggested guidance.

**Legend**

- Membrane Interface Probe (MIP) Location
- Soil Boring Location
- DPT Sampling Location
- Monitoring Well Location (showing screen interval, ft BLS)
- Cleared Trails

Jacobs comment #1: Figure 10 – For locations that have 2 sample dates (i.e. DPT0105), which dataset is included in the tag box?

*Response: Each sample date is included in the tag box. Multiple sampling dates at the same locations were employed to collect samples from intervals that had not been sampled.*

Data collected on 1/11/12

Data collected on 10/3/12

| DPT0174 (Jan-12 & Oct-12) | | | | | | |
|---|---|---|---|---|---|---|
| Interval | PCE | TCE | cDCE | tDCE | 1,1-DCA | VC |
| 26 to 30 | 1.0 U | 1.0 U | 1.0 U | 2.4 | NA | 1.4 |
| 31 to 35 | **10 U** | **22** | **1,600** | 48 | NA | **720** |
| 36 to 40 | **50 U** | **13 U,I** | **2,800** | 80 | NA | **740** |
| 41 to 45 | **50 U** | **31 I** | **2,600** | 85 | NA | **400** |
| 46 to 50 | **20 U** | 5 U,I | **1,100** | 37 | NA | **280** |
| 51 to 55 | 1.0 U | 1.0 U | **170** | 3.5 | NA | **76** |
| 56 to 60 | 1.0 U | 1.0 U | 3.8 | 1.0 U | NA | 1.0 U |

Figure 17

# Response to Comment

Jacobs comment #2: Slide 31/Figure 18 (new Slide 35) **[a]** According to Figure 13, the TCE result of 3.6 µg/L at DPT0227 is from the 46-50 ft bls interval, not "greater than 56 ft bls." No data is shown for DPT0227 past the 46-50 ft bls interval on Figure 13, so it appears that it should be "gray" on Figure 18. **[b]** It is understood that "note #8" on this figure explains that the data shown is from the bottom depth interval for each location. However, consider showing the highest result from the intervals sampled below 56 ft bls. In this case, for a location like DPT0244, which had two depths sampled below 56 ft bls (56-60 ft bls and 66-70 ft bls), the TCE data from the 56-60 ft bls interval would be shown (11 µg/L) and would be part of the 3 µg/L isopleth. Currently, the figure shows the TCE data (0.74 µg/L) for the lowest interval (66-70 ft bls) and is, therefore, not part of the 3 µg/L isopleth.

*Response:*

*[a] Comment noted; Figure 13 has been updated.*

*[b] Comment noted; the objective of this figure is to show vertical delineation. If the highest detection in this mapping interval is shown, it may give the impression that delineation has not been achieved.*

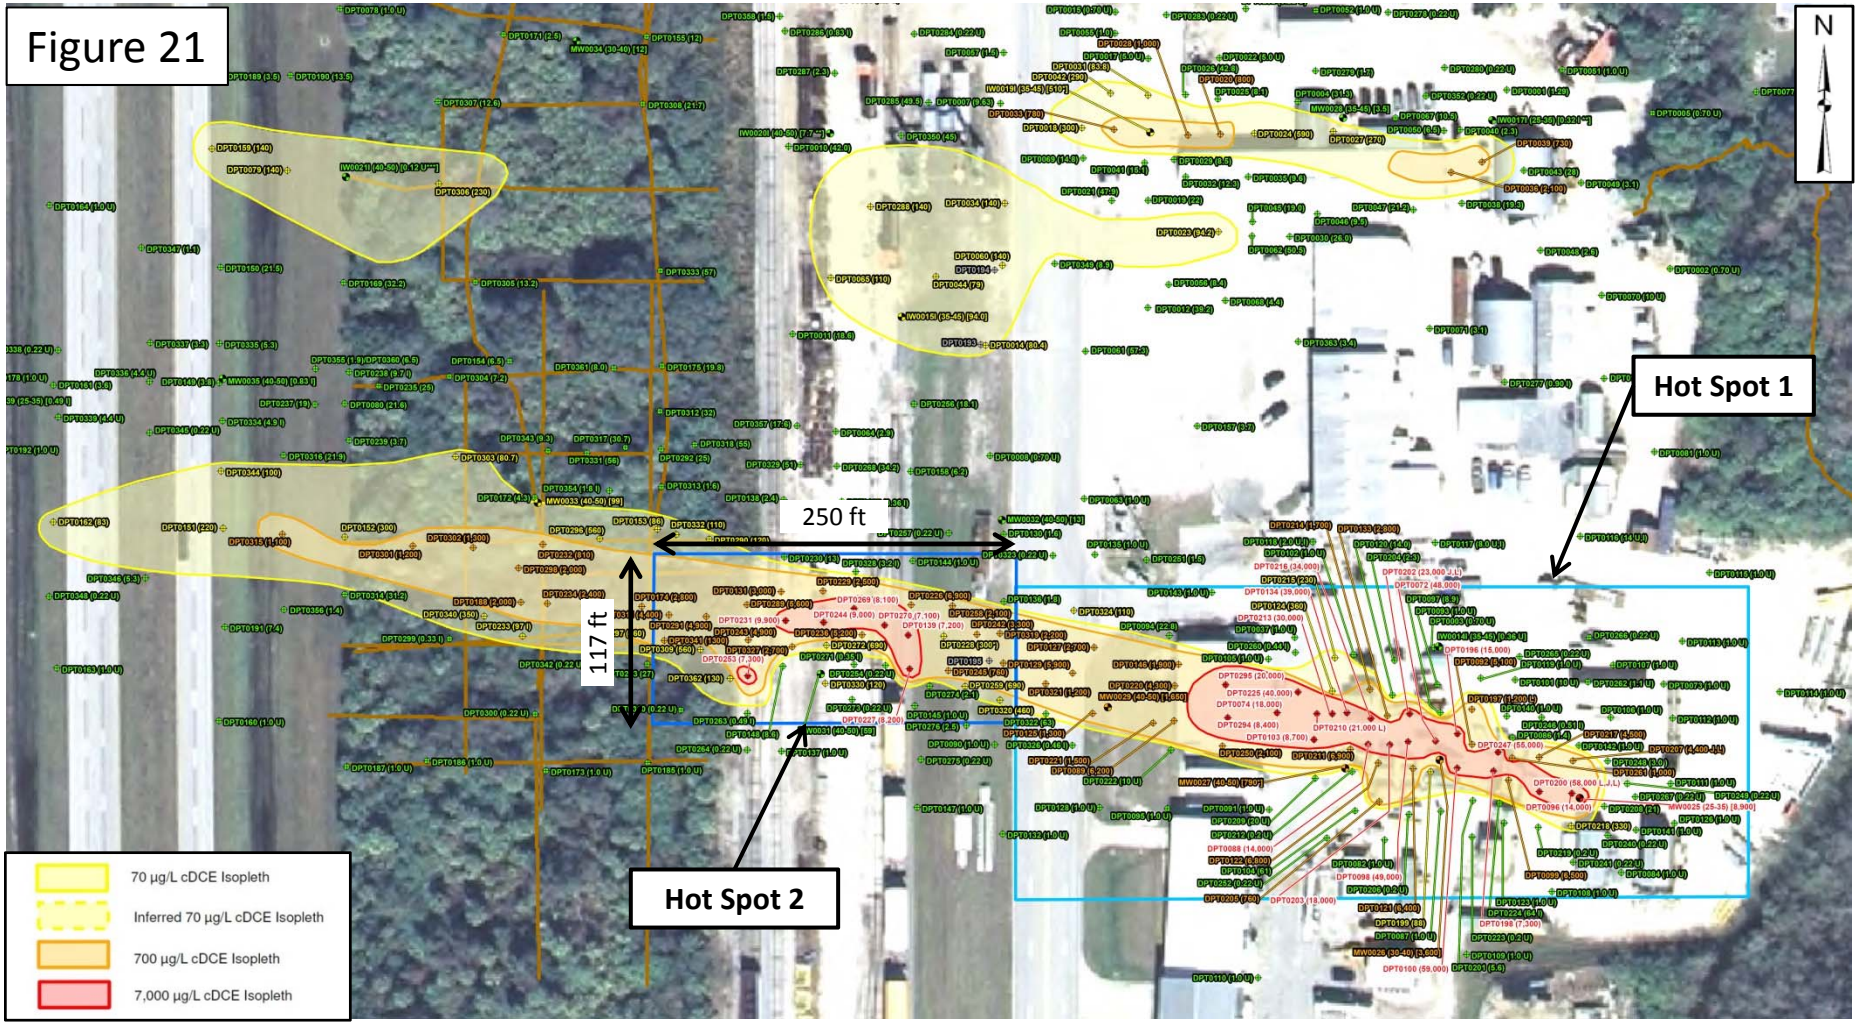
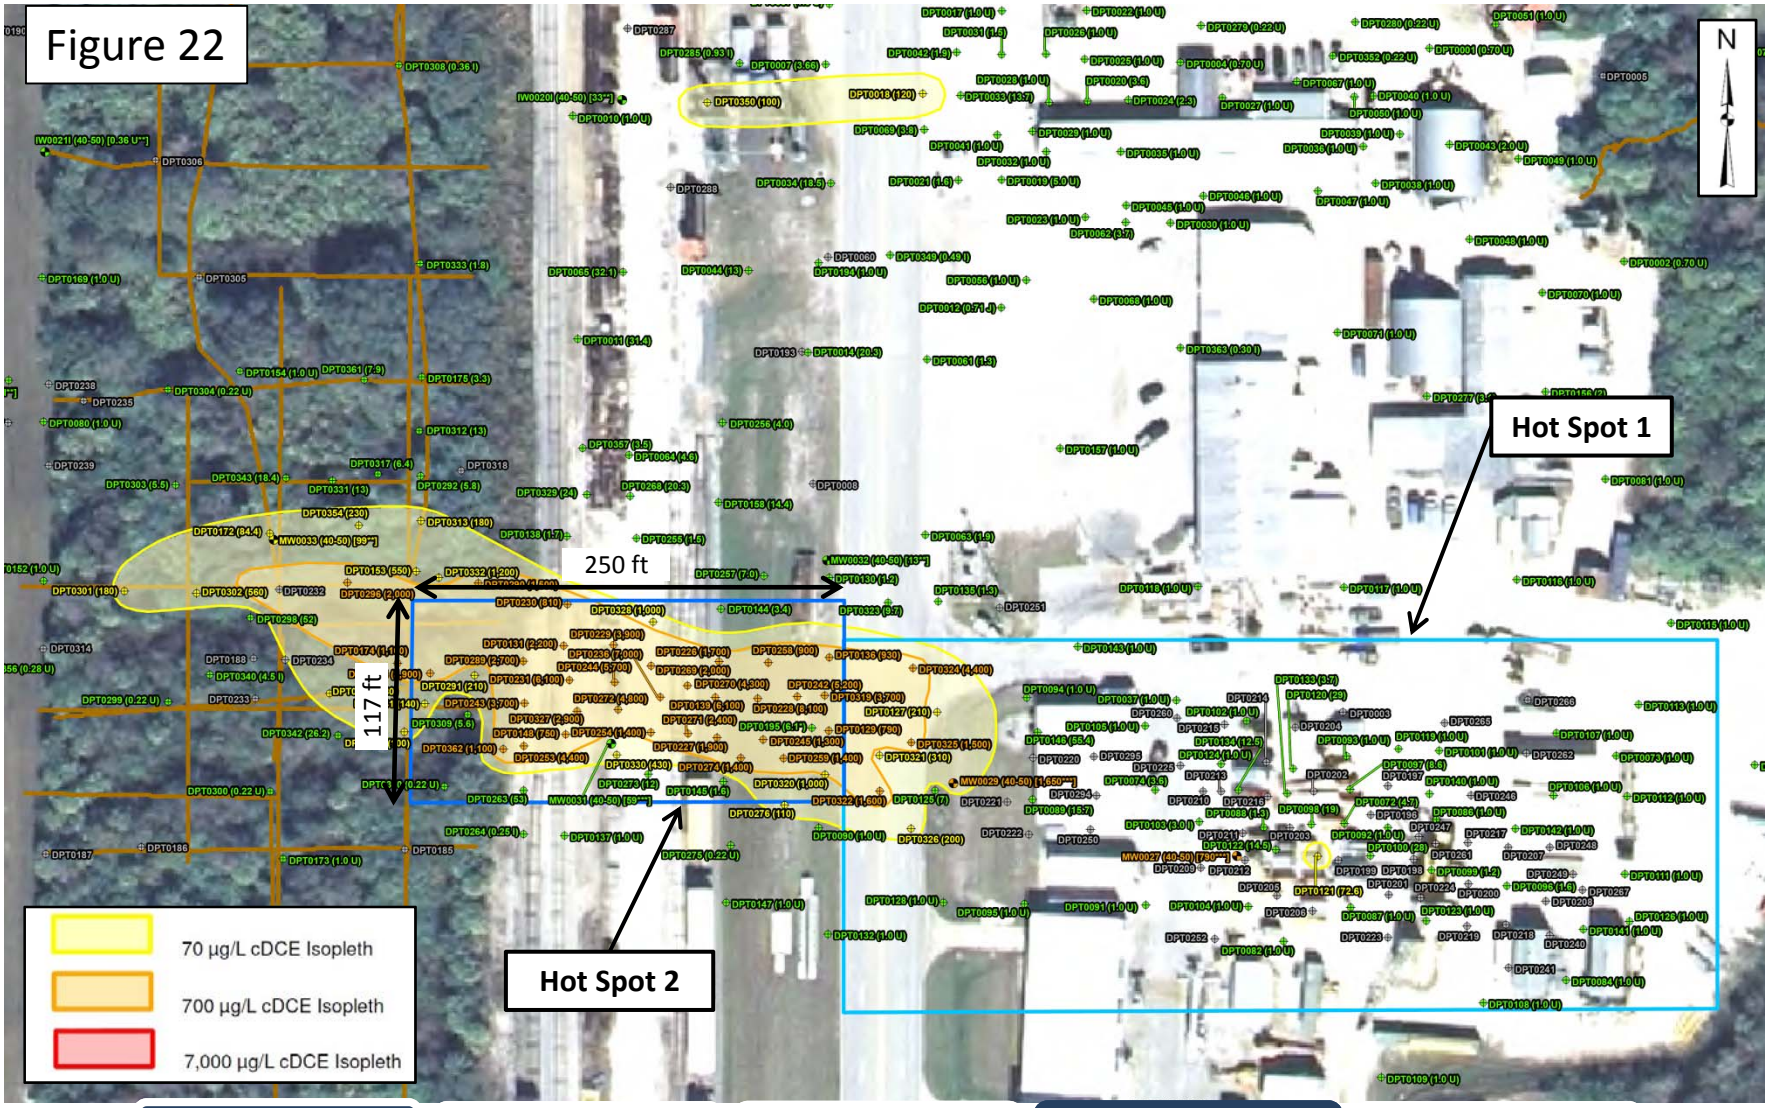
Figure 21



Geosyntec consultants

# cDCE 46 to 56 ft BLS

Figure 22



Jacobs comment #3: Slide 36/Figure 23 (new Slide 41) - It is understood that "note #8" on this figure explains that the data shown is from the bottom depth interval for each location. However, consider showing the highest result from the intervals sampled below 56 ft bls. In this case, for a location like DPT0244, which had two depths sampled below 56 ft bls (56-60 ft bls and 66-70 ft bls), the cDCE data from the 56-60 ft bls interval would be shown (110 µg/L) and would be part of the 70 µg/L isopleth. Currently, the figure shows the cDCE data (7.4 µg/L) for the lowest interval (66-70 ft bls) and is, therefore, not part of the 70 µg/L isopleth.

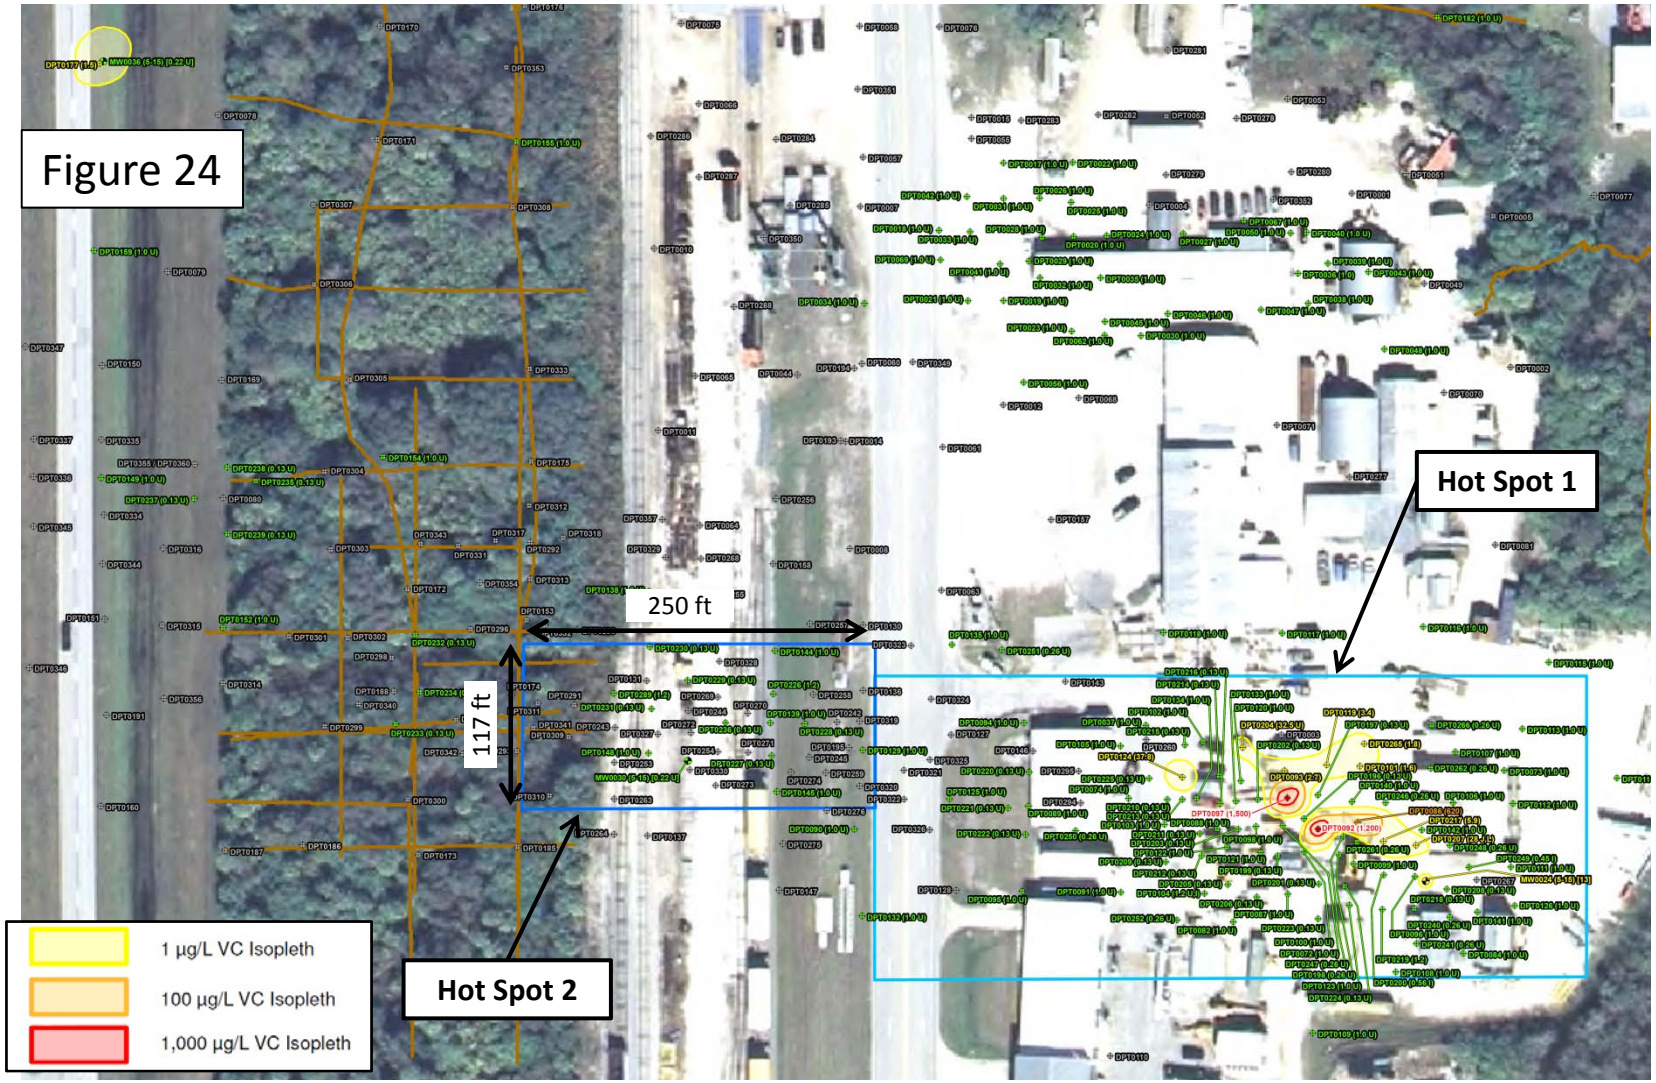
*Response: See response 2[b].*

# cDCE Greater than 56 ft BLS

Figure 23

Geosyntec consultants

# VC 8 to 16 ft BLS



# Response to Comment

TetraTech comment #3: Slide 38 (new slide 44) - **[a]** Should the LCP plume be shown as inferred south of DPT0044, **[b]** west of DPT0146/0220, **[c]** east of DPT0135? Samples were not collected from this [mapping] interval at those locations. **[d]** Additionally, the DPT spacing around DPT0336 does not appear to meet KSC spacing conventions. **[e]** For consistency, the LCP should be extended to include DPT0179 (e.g., DPT0162 was included).

*Response: [a] Geosyntec does not agree that the LCP should be shown as inferred S of DPT0044. The distance between DPT0060 and DPT0065, which both had VC concentrations below 2.0 µg/L in this mapping interval, is approximately 120 ft. Based on the VC concentrations at DPT0060 and DPT0065 and at the following locations, the LCP is delineated in this area: 31-35 ft BLS interval from DPT0044 (2.3 µg/L), 31-35 ft BLS interval from DPT0014 (0.80 U µg/L), and 26-30 ft BLS interval from DPT0011 (0.80 U µg/L).*

*The VC 16-30 ft BLS plume map has been revised to show VC concentrations from the 31-35 ft BLS intervals of DPT0044 and DPT0014 for lateral delineation interpretation.*

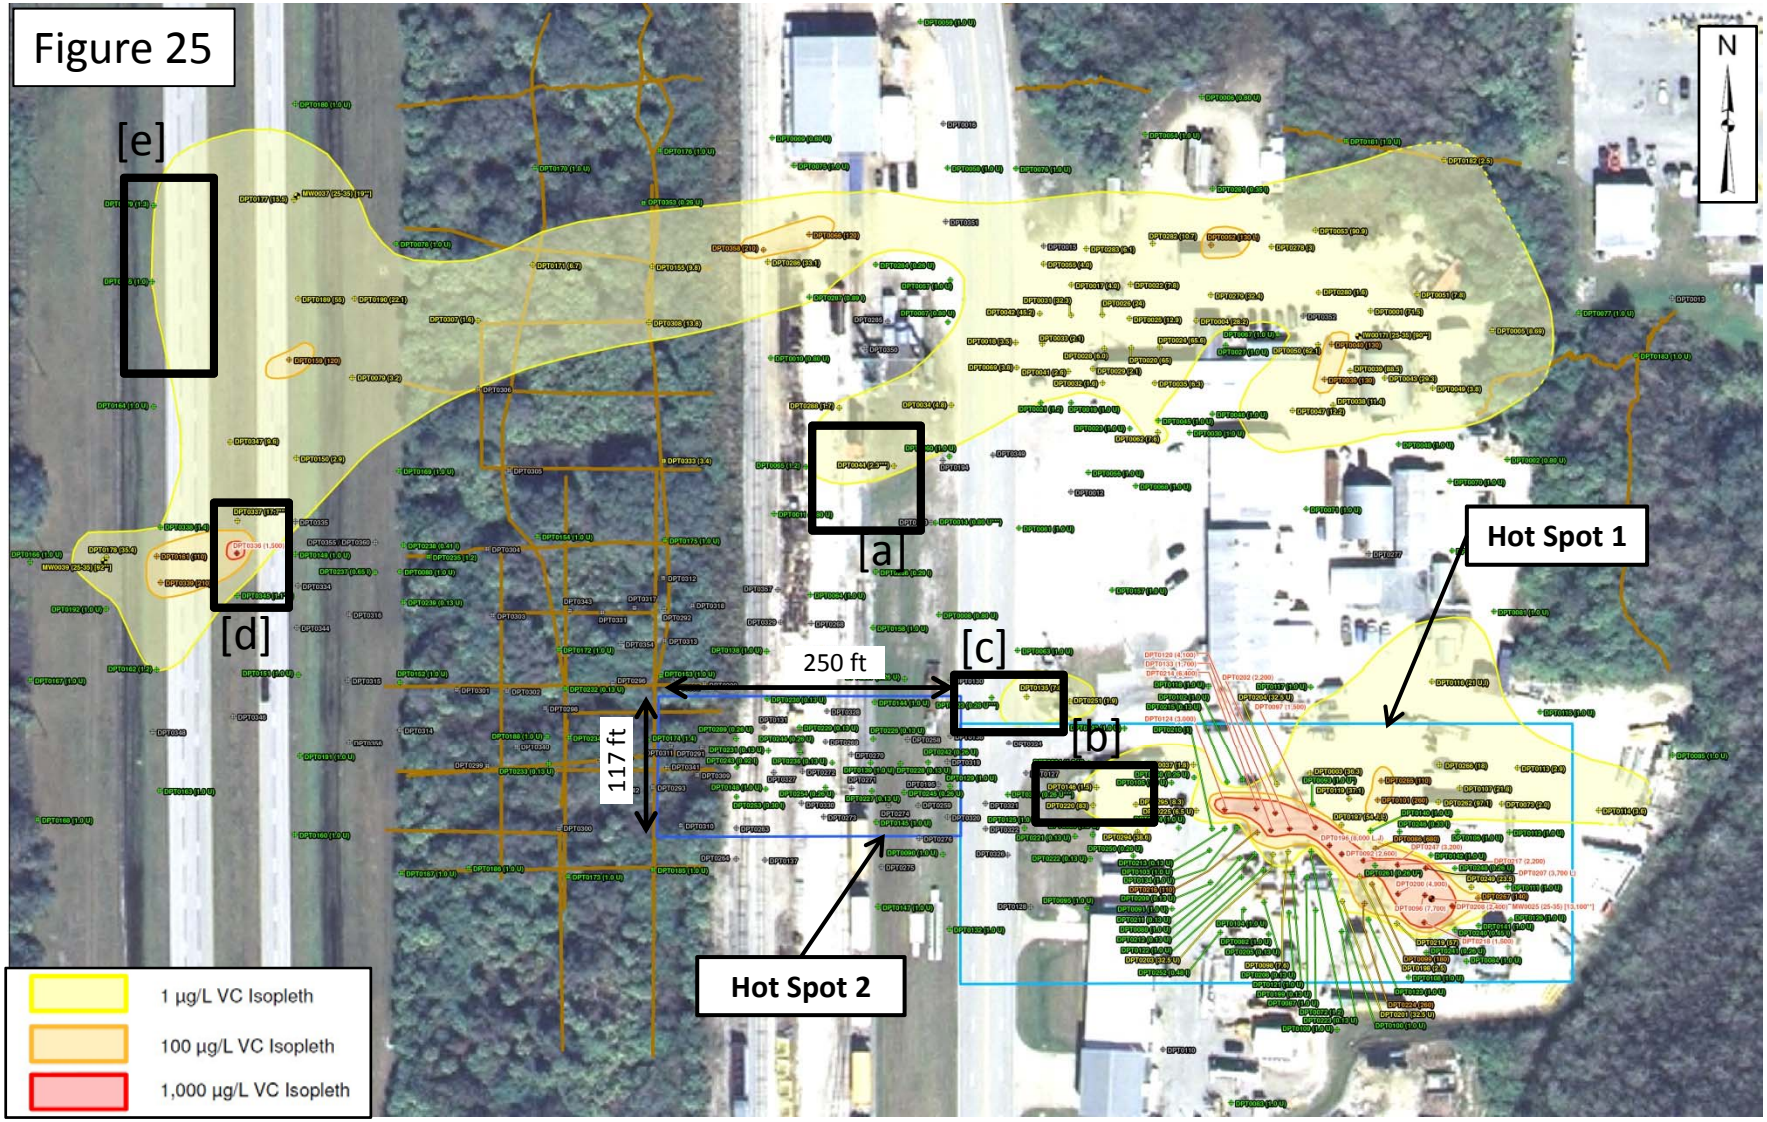
*[b] Geosyntec does not agree that the LCP should be shown as inferred W of DPT0146/220 based on the VC concentration in the 36-40 ft BLS interval from DPT0325 (0.26 U µg/L). The VC 16-30 ft BLS plume map has been revised to show VC concentrations from the 36-40 ft BLS interval of DPT0325 for lateral delineation interpretation.*

*[c] Geosyntec does not agree that the LCP should be shown as inferred W of DPT0135 based on the VC concentration in the 36-40 ft BLS interval from DPT0323 (0.26 U µg/L). The VC 16-30 ft BLS plume map has been revised to show VC concentrations from the 36-40 ft BLS interval of DPT0323 for lateral delineation interpretation.*

*[d] Comment noted; although DPT spacing around DPT0336 shown on the 16-30 ft BLS interval map does not meet the specific spacing suggestion in the Step process, VC detections at DPT0337 (17.7 µg/L) and DPT0345 (1.1 µg/L) from the 31-35 ft BLS interval (i.e. the interval immediately below the 1,500 µg/L VC detection in DPT0336) indicate that the current contour interpretation is valid. The VC 16-30 ft BLS plume map has been revised to show VC concentrations from the 31-35 ft BLS intervals of DPT0337 and DPT0345 for lateral delineation interpretation. If an interim measure is necessary in this area, additional sampling may be completed at that time.*

*[e] Comment noted; the VC 16-30 ft BLS plume map was adjusted slightly to include DPT0179 and DPT0165 in the 1.0 µg/L contour; however, this does not represent a material impact to the LCP.*

# VC 16 to 30 ft BLS



# Response to Comment

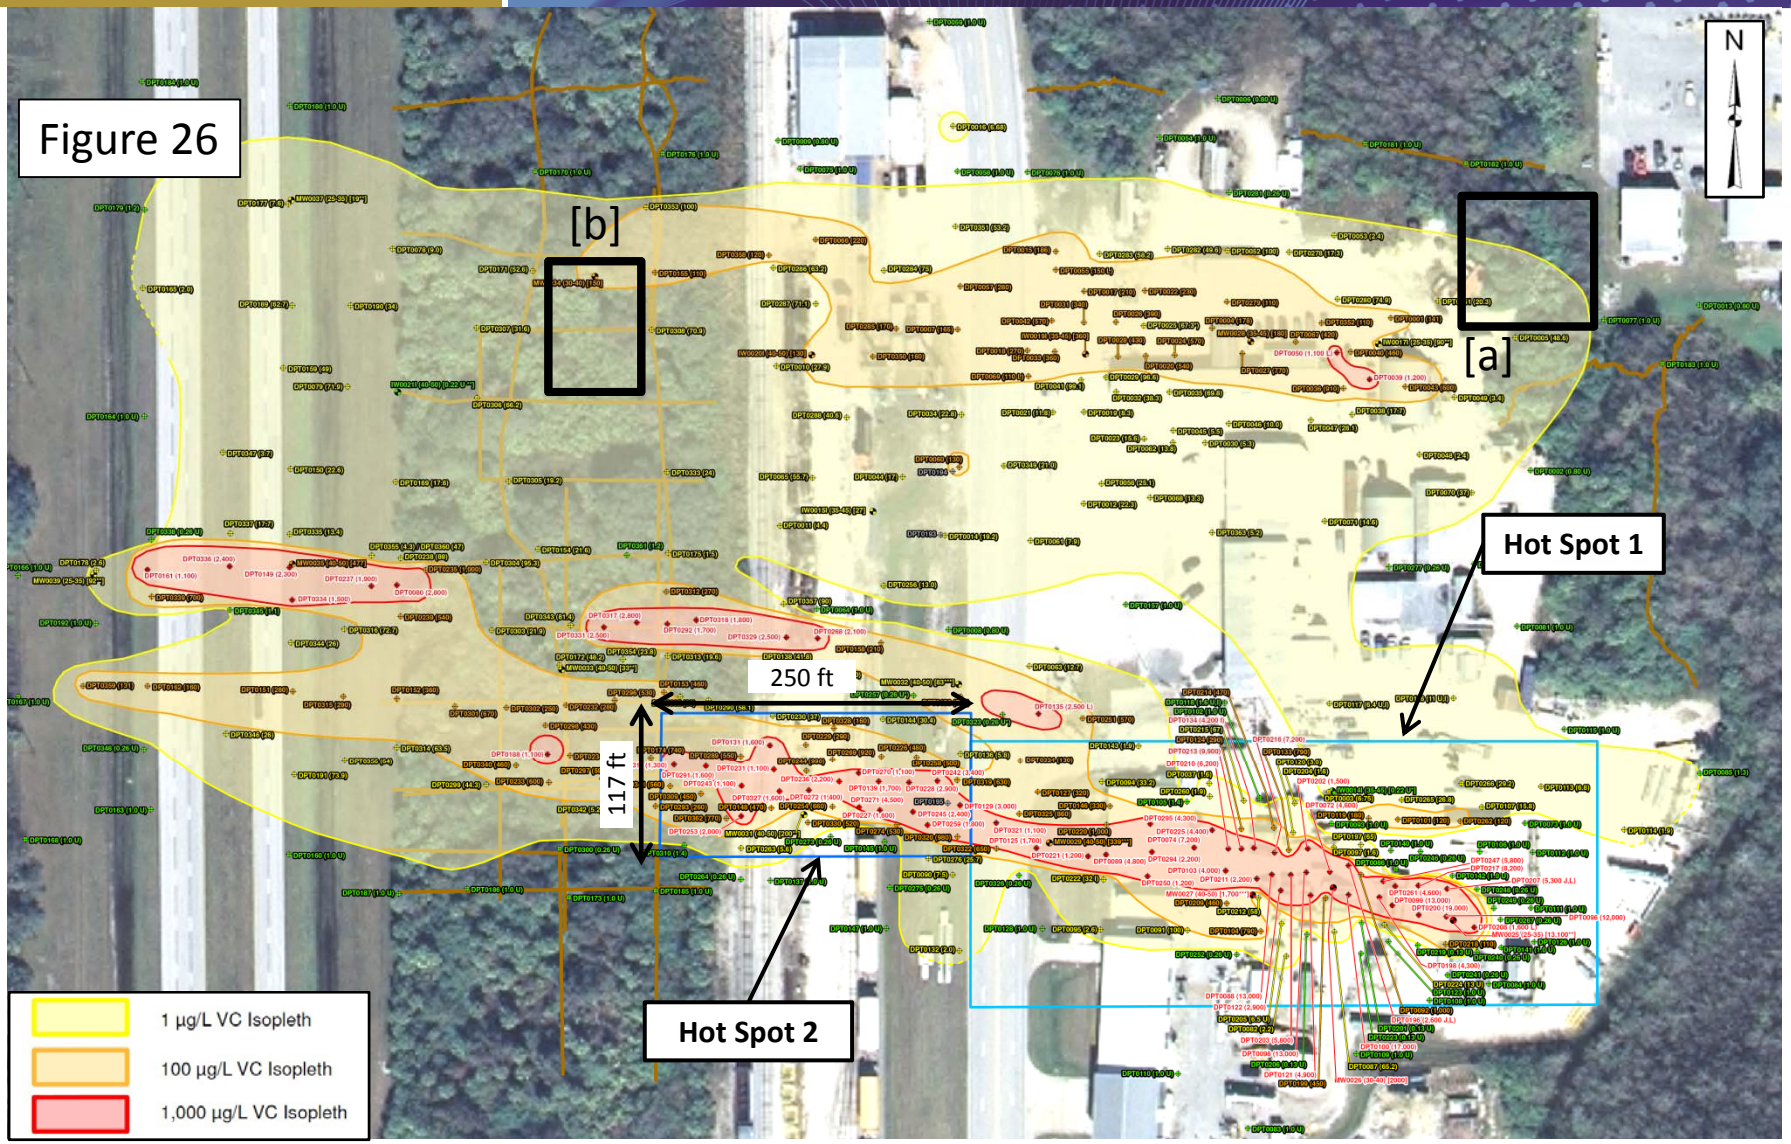
TetraTech comment #4: Slide 39 (new Slide 46) - [a] Suggest showing LCP as inferred in the northeast most portion of the LCP northeast of DPT005, as there are not points bounding the plume in this direction between DPT0182 and DPT0077. [b] Please also identify the area south of MW0034 as a data gap, as the HCP is not delineated to the south of this location.

*Response: [a] Geosyntec's contour interpretation of the peripheral DPT locations in this area is based on observed VC concentrations less than 1.0 µg/L in DPT0181, DPT0182, DPT0077, and DPT0013.*

*[b] Comment noted. Geosyntec agrees that there is not a DPT location that meets the specific spacing suggestion in the Step process south of MW0034. However, given the VC concentrations detected in DPT0307 (31.6 µg/L) and DPT0308 (70.9 µg/L), we are comfortable with the delineation as presented. Sampling in this area has not occurred to date due to wetland conditions. If accessible, additional sampling may be conducted at a later date, if needed.*

Geosyntec consultants

# VC 31 to 46 ft BLS



# Response to Comment

TetraTech comment #5: Slide 40 (new Slide 49) - [a] The HCP is not bound in the northern direction of DPT0301 and DPT0302 to the north and northwest. Suggest more conservative contouring in this area as well as identification of data gap. [b] We also suggest south of DPT0350 and IW0020I be identified as an HCP data gap, as data is not available in this direction near the referenced locations.

*Response: [a] Geosyntec agrees that there is a data gap at this location when comparing to the specific spacing suggestions in the Step process; however, this data gap can be filled at a later date, if needed. The VC 46-56 ft BLS plume map has been updated with more conservative contouring.*

*[b] Geosyntec agrees that there is not a DPT location that meets the specific spacing suggestion in the Step process in this area of the 46-56 ft BLS mapping interval; however, based on the VC detections in the 41-45 ft BLS interval at DPT0288 (40.6 µg/L) and 46-50 ft BLS interval at DPT0010 (48.4 µg/L), we are comfortable with the delineation as presented.*

# Response to Comment

TetraTech comment #6: Slide 40 (new Slide 49) - Agree with inferred plume boundary along southwestern tail near DPT0163. Suggest plume boundaries be shown as inferred boundaries near DPT0264 and around DPT0016 (northern isolated detection)?

*Response: Comment noted; plume boundary near DPT0264 and around DPT0016 shown as inferred.*

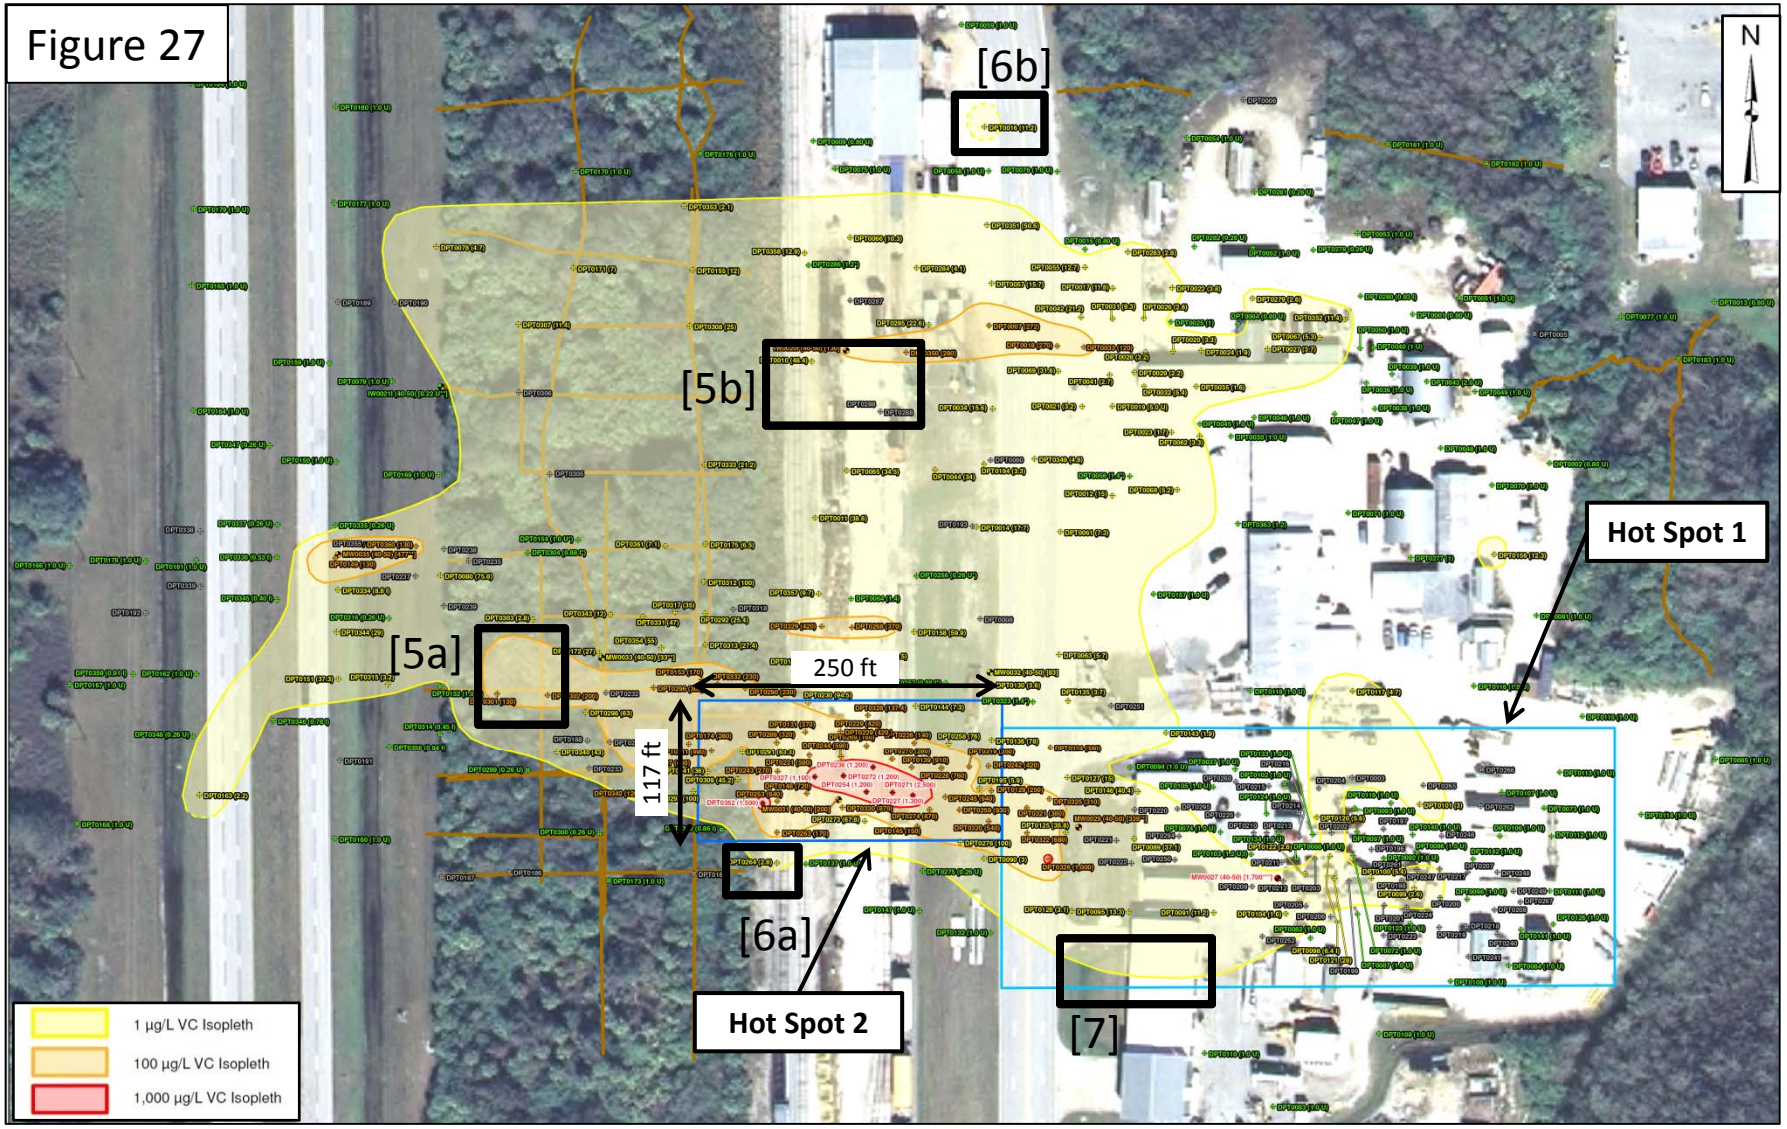
TetraTech comment #7: Slide 40 (new Slide 49) - The LCP south of the Hot Spot 1 area appears to not be delineated, as the plume south of DPT0091 and DPT0095 is not bound to the south by single-digit detections.

*Response: DPT0110 meets the spacing requirements of S of DPT0091 and our request to collect a sample S of DPT0095 was denied due to utilities. Based on the results at DPT0110 and our understanding of the conceptual site model, we are comfortable with the delineation presented.*

Geosyntec consultants

# VC 46 to 56 ft BLS

Figure 27



Jacobs comment #4: Slide 41/Figure 28 (new Slide 51) - It is understood that "note #10" on this figure explains that the data shown is from the bottom depth interval for each location. However, consider showing the highest result from the intervals sampled below 56 ft bls. In this case, for a location like DPT0244, which had two depths sampled below 56 ft bls (56-60 ft bls and 66-70 ft bls), the VC data from the 56-60 ft bls interval would be shown (10 µg/L) and would be part of the 1 µg/L isopleth. Currently, the figure shows the VC data 0.58 µg/L) for the lowest interval (66-70 ft bls) and is, therefore, not part of the 1 µg/L isopleth.

*Response: See response 2[b].*

| **Total Mass** | | **59 lbs of TCE** | | | | **128 lbs of cDCE** | | | | **47 lbs of VC** | | | | * |

*Total CVOC mass (excluding potential DNAPL) within LCP and HCP areas = **234 lbs**

**Notes:**

1. Dissolved mass calculation method: Calculate the area of each COC contour interval, i.e. GCTL to NADC, NADC to 10xNADC, >10xNADC, (For TCE: 3 to 300 µg/L, 300 to 30,000 µg/L, > 30,000 µg/L). Calculate the plume pore volume (area multiplied by depth interval and porosity). Calculate the average CVOC concentration using DPT data located within each COC contour interval in the depth interval of interest. Pore volume multiplied by average concentration yields mass.
2. Sorbed mass calculation method: Use the area of each contour interval as described in note 1. Calculate the soil volume (area multiplied by depth interval) and convert to soil mass (multiply by assumed density of 100 lb/ft$^3$). Calculate the equilibrium soil concentrations using average dissolved CVOC concentrations calculated above, the fraction organic carbon (foc) provided in table above and the Koc's presented below. The soil concentration multiplied by the soil mass yields the sorbed mass.
3. Porosity was assumed to be 0.25.
4. foc is depth interval-specific and based on data from HMF North.
5. Koc data is from Sawyer, McCarty and Parkin (2003) and are TCE: 165.7 L/kg; cDCE: 45.6 L/kg; and VC: 26.3 L/kg.
6. Calculations do not consider potential DNAPL mass.

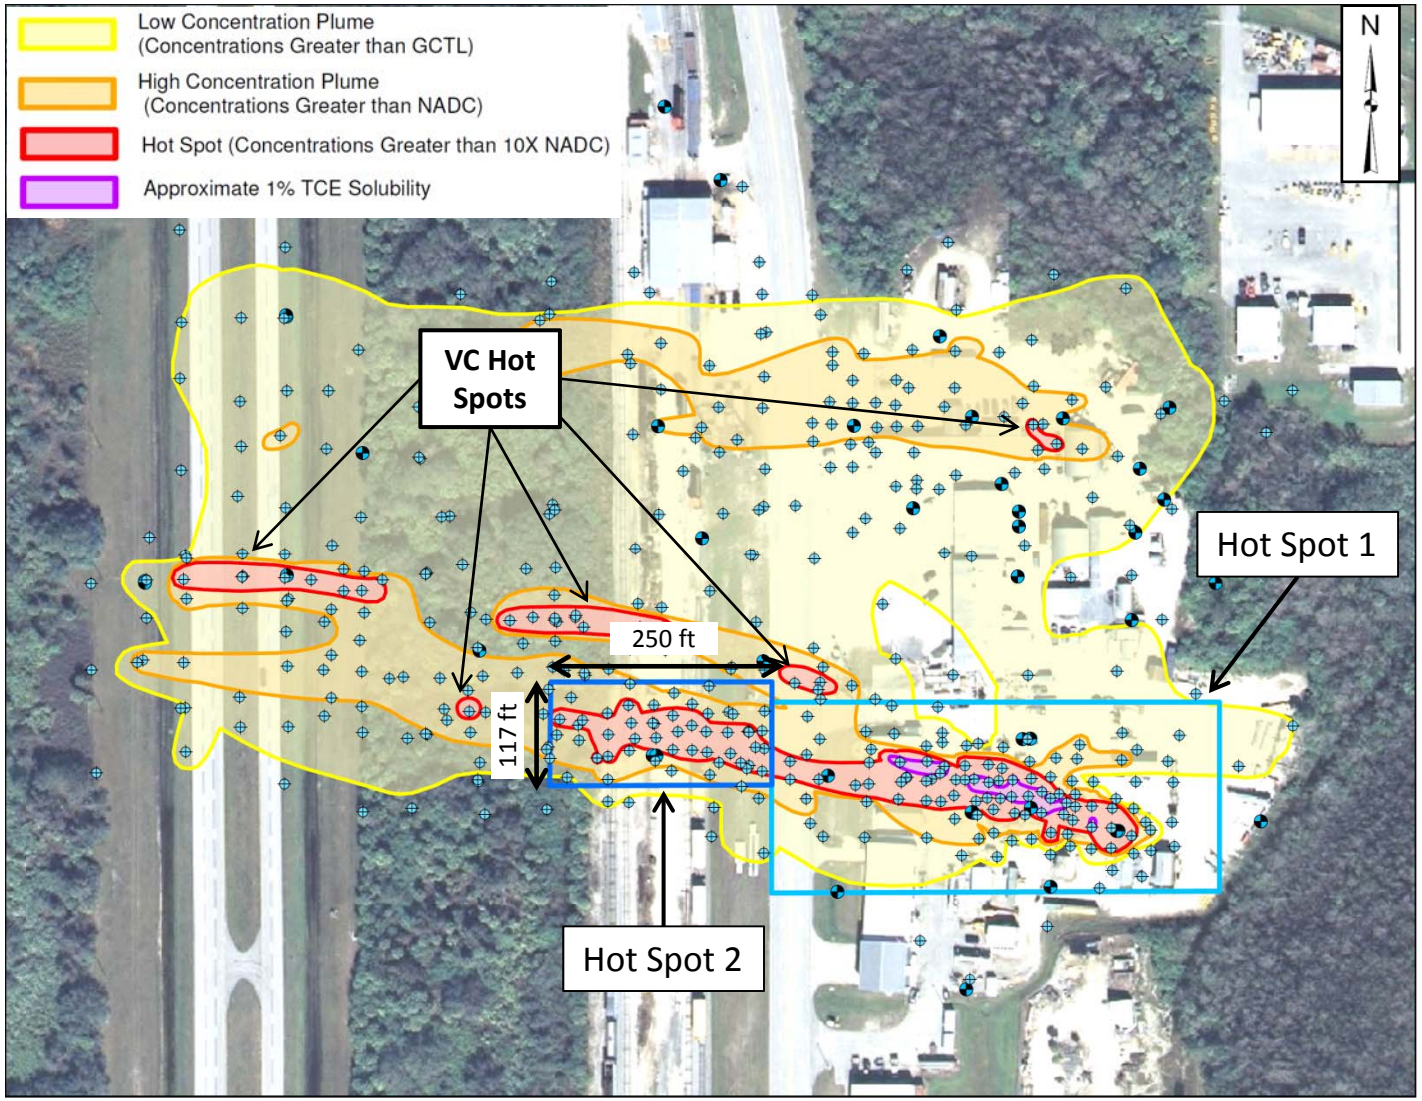
# Overall Combined Depth CVOC Plume Map

- HS2: Area west of Hot Spot 1 with CVOC impacts greater than 10XNADC
- HCP: refers to site-wide CVOC impacts greater than NADC
- LCP: refers to site-wide CVOC impacts greater than GCTL



# Site Plumes

| Designation | Concentrations | Acreage |
|---|---|---|
| LCP (site-wide) | >GCTL | 14.90 |
| HCP (site-wide) | >NADC | 4.37 |
| HCP (HS2) | >NADC | 0.25 |
| Hot Spot (site-wide) | >10XNADC | 1.01 |
| 1% TCE Solubility | >11,000 µg/L | 0.06 |

- Step 1B focused on HS2 and HCP plumes

# Review of Site Conditions

- Heavy vegetation and wetlands near western boundary of HS2 and most of HCP
- HS2 and HCP include wetlands, multiple railroads, drainage ditch, and Kennedy Parkway
- Impacts generally present from 8 to 50 ft BLS
  - Majority of CVOC contaminant mass is located from 31 to 45 ft BLS (91%)
- Lithology is primarily sand until approximately 45 ft BLS (based on visual observations, MIP, and DPT data)
  - Below approximately 45 ft BLS lithology is silty sand, with varying amounts of clay (semi-confining layer)

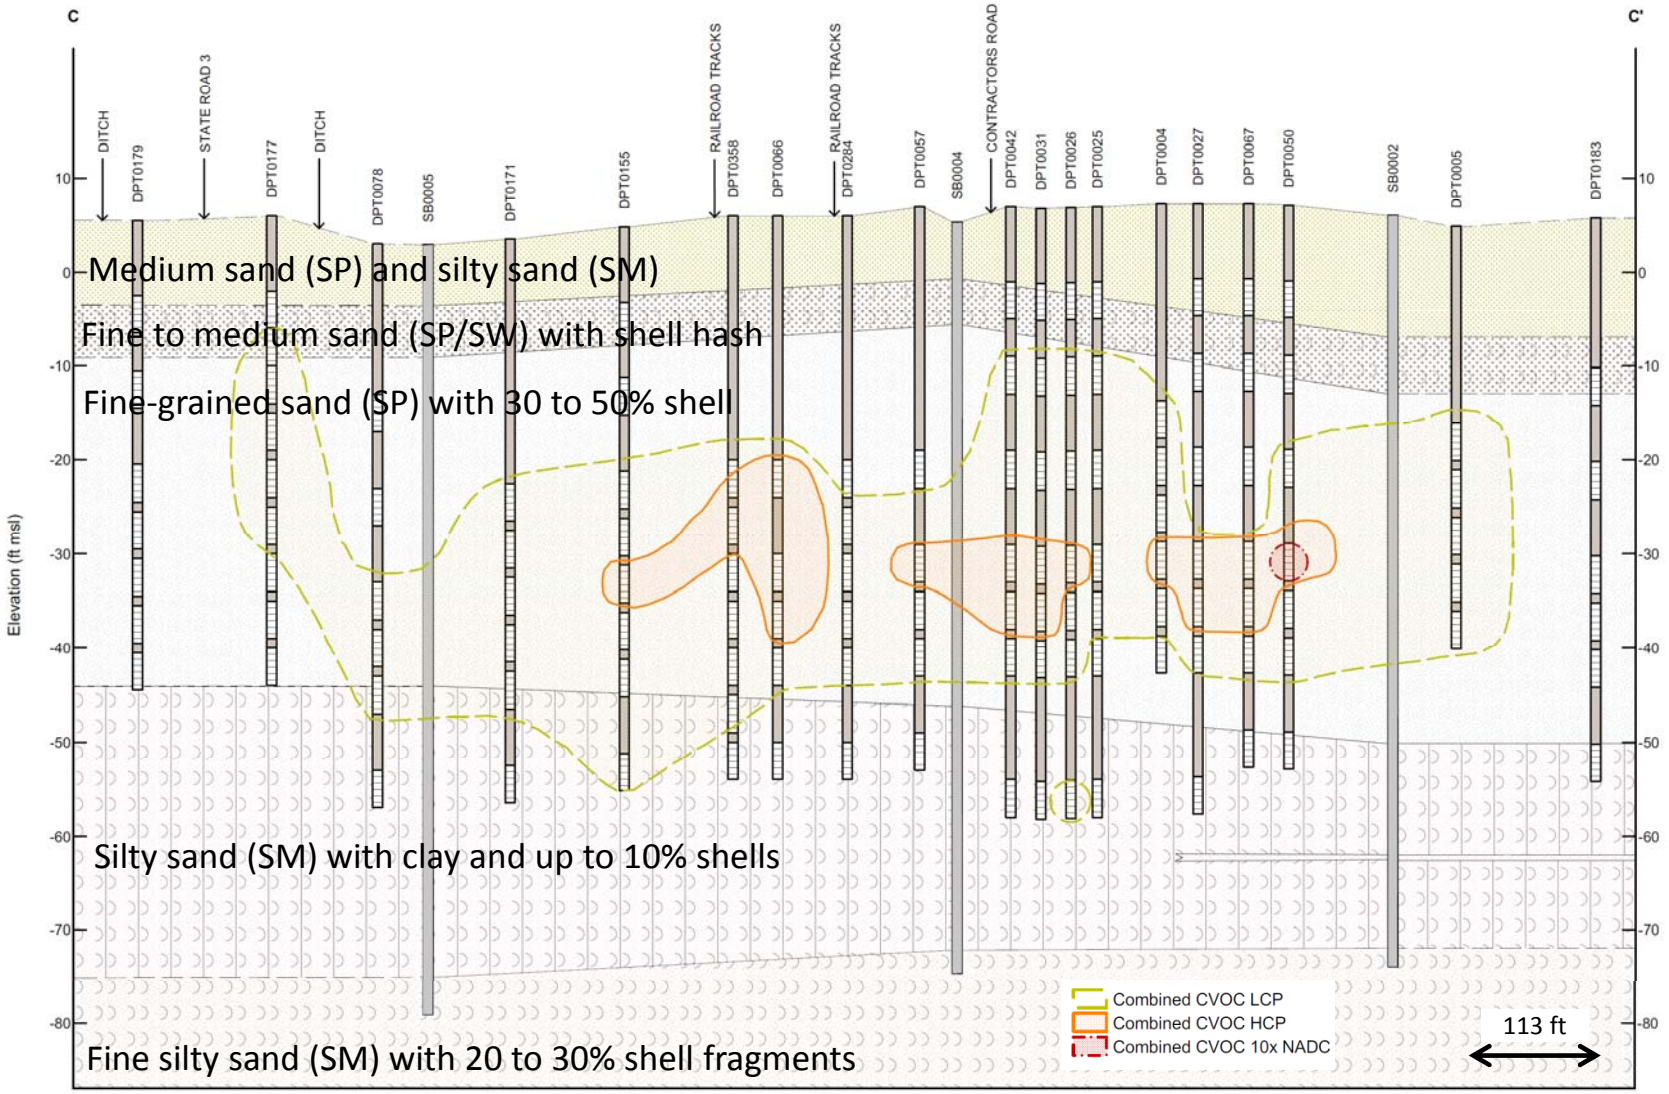
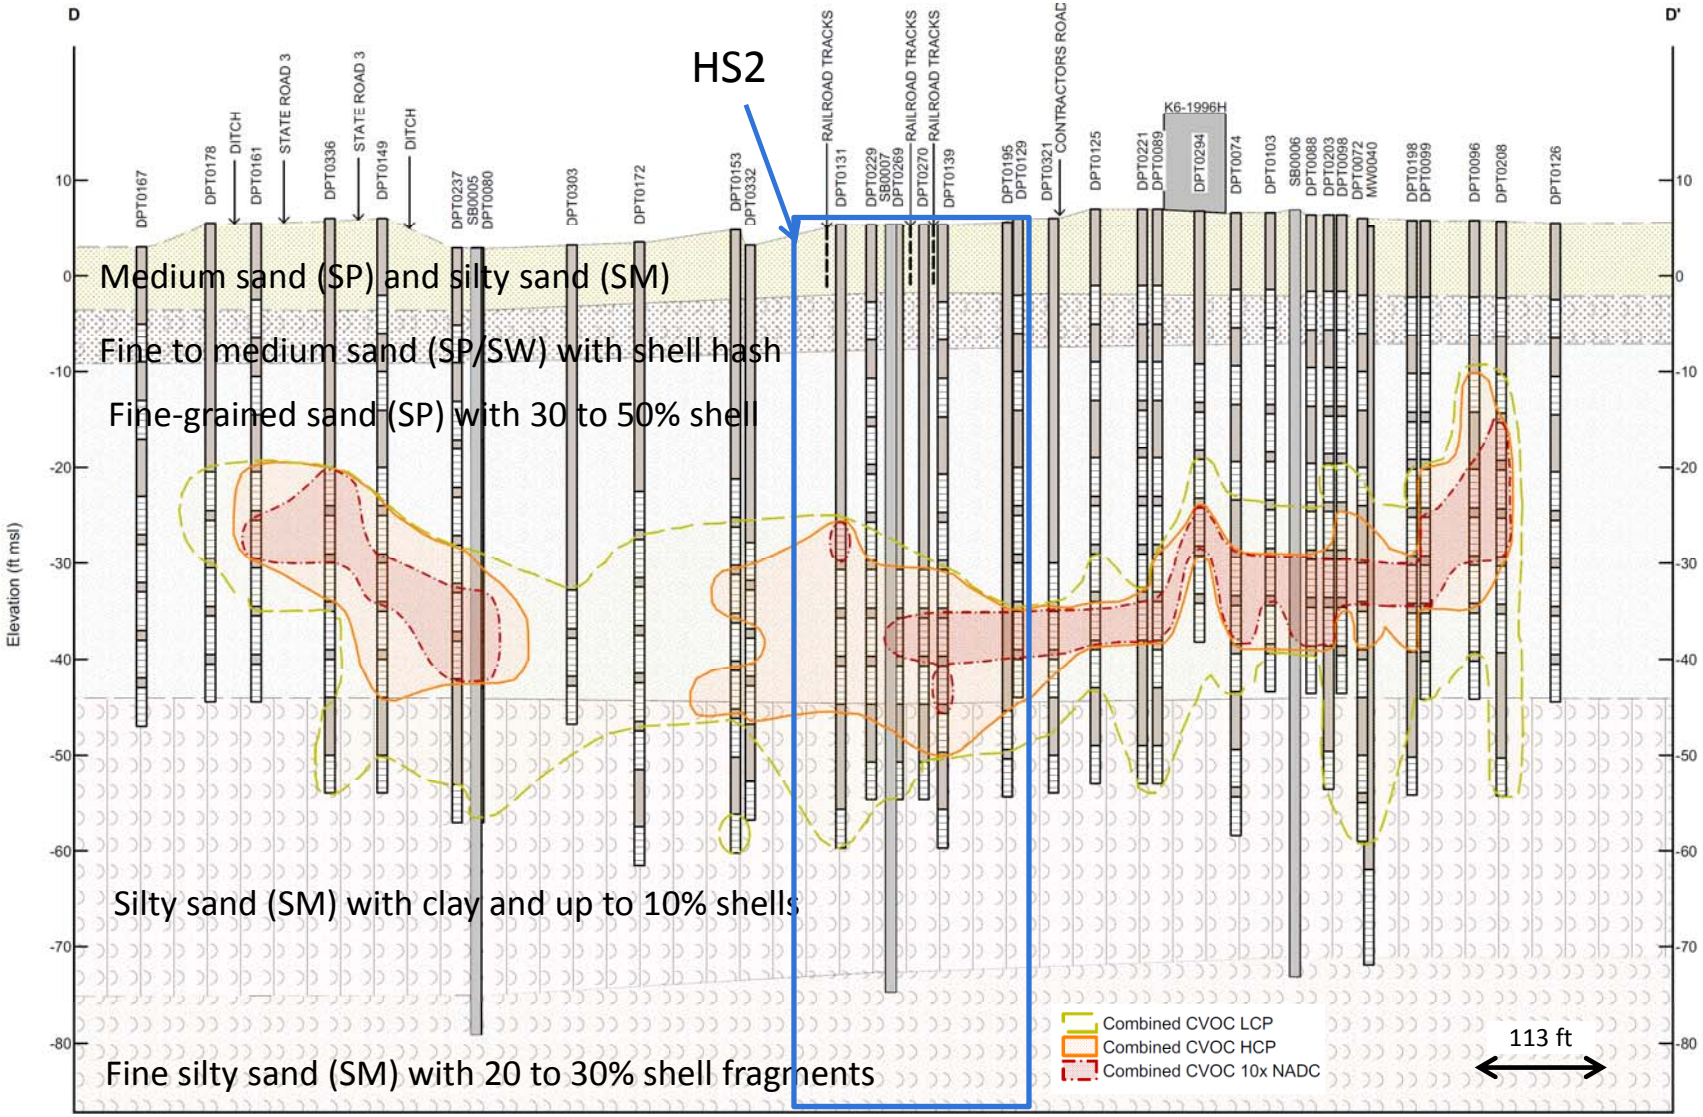
# C-C' Composite CVOC Cross Section



# D-D' Composite CVOC Cross Section



# Low Concentration Plume (site-wide)

| Technology | Screening Result and Rationale |
|---|---|
| *No Action*<br>No Further Action | **Eliminated** – Not protective of human health and environment or allowed from a regulatory perspective. |
| *Limited Action (Passive)*<br>Institutional Controls | **Retained** – Facility Land Use Controls warranted to prevent exposure to groundwater and/or installation of potable wells. |
| Monitoring (LTM, MNA) | **Retained** – Implement LTM/MNA groundwater program to monitor site conditions. |
| *Action (Aggressive)* | **Eliminated** – Aggressive actions for LCP not warranted at this time; therefore, no detailed screening necessary. There are no receptors for impacts associated with LCP or nearby OFWs that could potentially be impacted. |

# High Concentration Plume (site-wide)

| Technology | Screening Result and Rationale |
|---|---|
| *No Action* | |
| No Further Action | **Eliminated** – Not protective of human health and environment or allowed from a regulatory perspective. |
| *Limited Action (Passive)* | |
| Institutional Controls | **Retained** – Facility Land Use Controls warranted to prevent exposure to groundwater and/or installation of potable wells. |
| Monitoring (LTM, MNA) | **Retained** –Implement LTM/MNA groundwater program to monitor site conditions in conjunction with implementation of another technology. |
| *Action (Aggressive)* | |
| GW Extraction (Hydraulic Containment, pump and treat) | **Conditionally Retained** – Only suitable for plume containment and/or as a component of another aggressive treatment technology. |
| Impermeable Barrier | **Eliminated** – Not feasible due to site features (buildings, roads and railroad tracks); multiple discrete areas. |
| Bioremediation (Bioaugmentation, Biostimulation) | **Retained** – Reductive dechlorination occurring at site based on MEE, sulfate, sulfide, Dhc, vcrA, cDCE and VC sampling results from HS1. |
| Large Diameter Auger (LDA) (solidification, steam, EZVI approaches) | **Eliminated** – Not feasible due to site features – buildings, roads and railroad tracks. |
| Air Sparge | **Retained** – Effective treatment above semi-confining layer (~45 ft BLS) for volatilization of CVOCs. |

# High Concentration Plume (site-wide)

| Technology | Screening Result and Rationale |
|---|---|
| *Action (Aggressive)* | |
| Multiphase Extraction (MPE) | **Eliminated** – No significant vadose zone/shallow impacts, high energy use if deployed for groundwater dewatering/extraction. |
| Heating Technologies | **Eliminated** – Technology better suited for significant DNAPL source zone and mass stored in low permeability zones. |
| Oxidation Technologies | **Eliminated** – Rebound and tailing effects would be anticipated and difficulties achieving effective oxidant distribution. |
| EZVI | **Eliminated** – Technology better suited for focused DNAPL source zones not dissolved CVOCs. |
| Co-Solvent Flushing | **Eliminated** – Technology better suited for focused DNAPL source zones. |
| Electrokinetic (EK) Enhanced Bio or ChemOx | **Eliminated** – Technology better suited for focused uniform distribution of e-donor, microbial culture, or oxidant in limited footprint areas with high level of heterogeneity and diffused mass/DNAPL in low permeability zones. |
| Excavation | **Eliminated** – Depth of impacts makes implementation infeasible. |

# Hot Spot 2 (>10xNADCs)

| Technology | Screening Result and Rationale |
|---|---|
| *No Action* | |
| No Further Action | **Eliminated** – Not protective of human health and environment or allowed from a regulatory perspective. |
| *Limited Action (Passive)* | |
| Institutional Controls | **Retained** – Facility Land Use Controls warranted to prevent exposure to groundwater and/or installation of potable wells. |
| Monitoring (LTM, MNA) | **Retained** –Implement LTM/MNA groundwater program to monitor site conditions in conjunction with implementation of another technology. |
| *Action (Aggressive)* | |
| GW Extraction (Hydraulic Containment, pump and treat) | **Conditionally Retained** – Only suitable for plume containment and/or as a component of another aggressive treatment technology. |
| Impermeable Barrier | **Eliminated** – Not feasible due to site features (buildings, roads and railroad tracks); multiple discrete areas. |
| Bioremediation (Bioaugmentation, Biostimulation) | **Retained** – Reductive dechlorination occurring at site based on MEE, sulfate, sulfide, Dhc, vcrA, cDCE and VC sampling results from HS1. |
| Large Diameter Auger (LDA) (solidification, steam, EZVI approaches) | **Eliminated** – Not feasible due to site features – buildings, roads and railroad tracks. |
| Air Sparge | **Retained** – Effective treatment above semi-confining layer (~45 ft BLS) for volatilization of CVOCs. |

# Hot Spot 2 (>10xNADCs)

| Technology | Screening Result and Rationale |
|---|---|
| *Action (Aggressive)* | |
| Multiphase Extraction (MPE) | **Eliminated** – No significant vadose zone/shallow impacts, high energy use if deployed for groundwater dewatering/extraction. |
| Heating Technologies | **Eliminated** – Technology better suited for significant DNAPL source zone and mass stored in low permeability zones; very limited area of hot spot would result in very high unit cost for technology application. |
| Oxidation Technologies | **Eliminated** – Rebound and tailing effects would be anticipated and difficulties achieving effective oxidant distribution. |
| EZVI | **Eliminated** – Technology better suited for focused DNAPL source zones not dissolved CVOCs. |
| Co-Solvent Flushing | **Eliminated** – Technology better suited for focused DNAPL source zones. |
| Electrokinetic (EK) Enhanced Bio or ChemOx | **Eliminated** – Technology better suited for focused uniform distribution of e-donor, microbial culture, or oxidant in limited footprint areas with high level of heterogeneity and diffused mass/DNAPL in low permeability zones. |
| Excavation | **Eliminated** – Depth of impacts makes implementation infeasible. |

# Engineering Data Gaps

- Evaluate permeability in silty sand with clay layer (45 to 60 ft BLS)

# Retained Technologies

| HS2 (> 10xNADC) | HCP (> NADC) | LCP (> GCTL) |

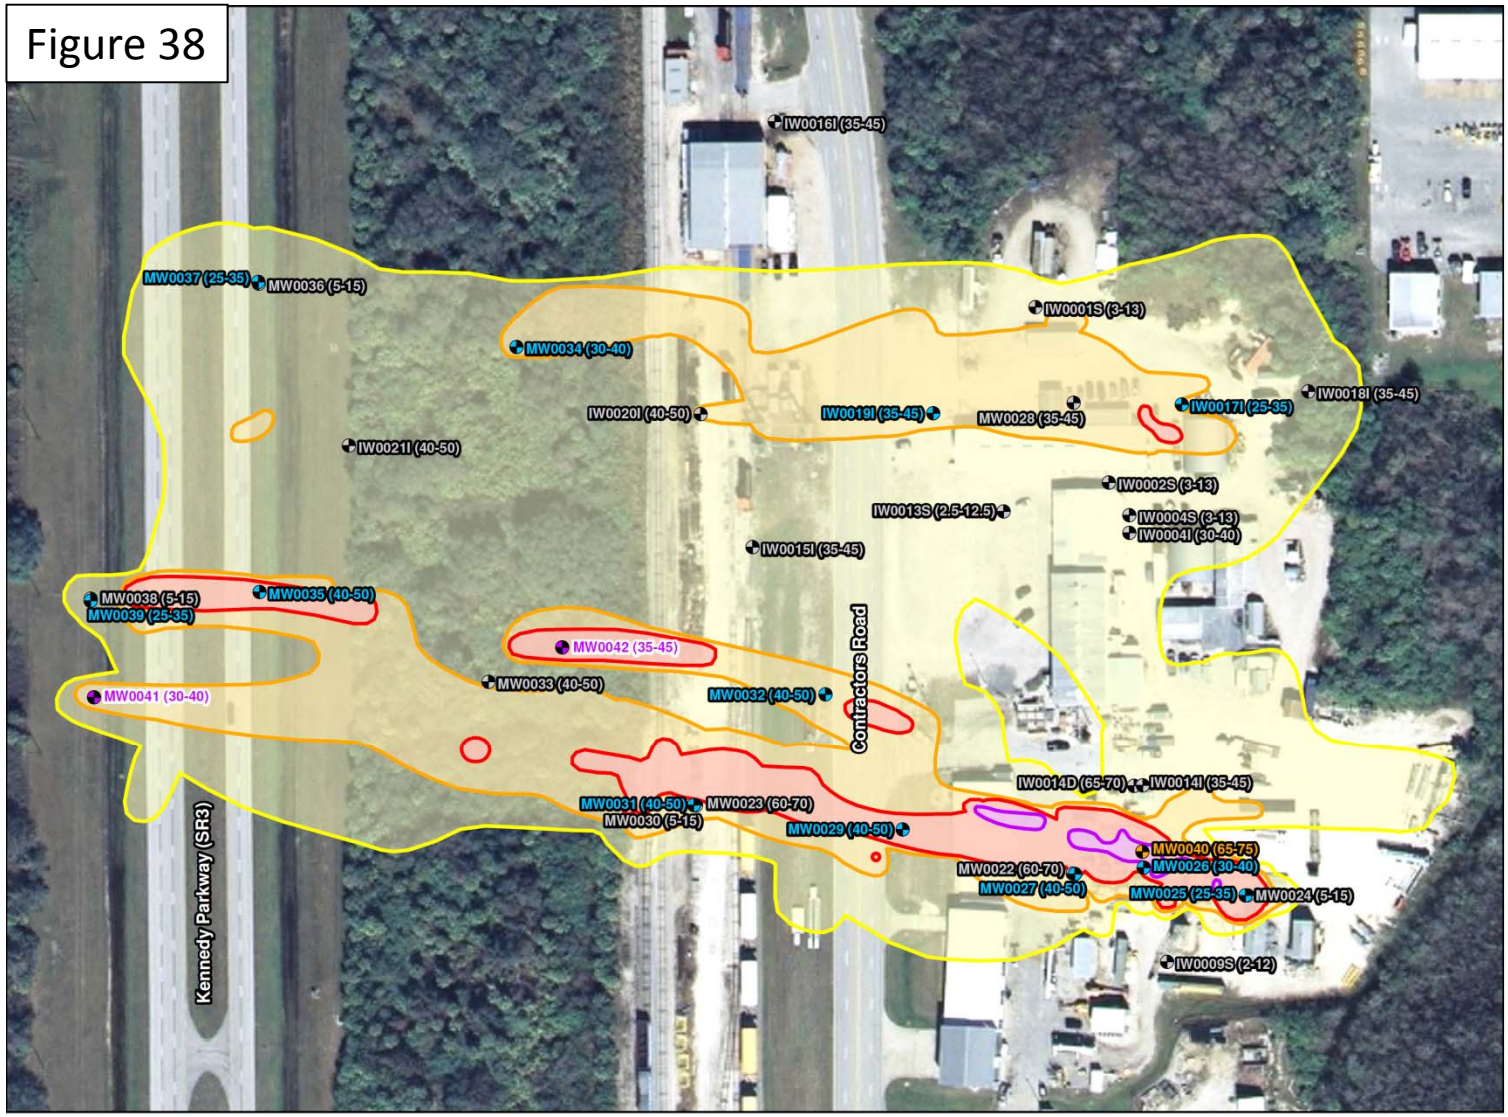
      - MNA

# Step 1 – Section C

Figure 38



Note:
1. Screen interval is presented in feet, below land surface (ft, BLS).

Geosyntec consultants

# Rationale Table

| Well Location | Screened Interval (ft BLS) | Analytes | Rationale |
|---|---|---|---|
| IW0017I | 25 to 35 | VOCs | VC exceeds NADC. |
| IW0019I | 35 to 45 | VOCs | cDCE (GCTL) and VC (NADC) exceedances. |
| MW0025 | 25 to 35 | VOCs; 1,4-D | Monitor NADC plume. |
| MW0026 | 30 to 40 | VOCs; 1,4-D | Monitor NADC plume. |
| MW0027 | 40 to 50 | VOCs | Monitor NADC plume. |
| MW0029 | 40 to 50 | VOCs; 1,4-D | Monitor NADC plume. |
| MW0031 | 40 to 50 | VOCs | VC exceeds NADC. |
| MW0032 | 40 to 50 | VOCs | VC exceeds GCTL and downgradient of VC HS. |
| MW0034 | 30 to 40 | VOCs | VC exceeds NADC and screened within main plume. |
| MW0035 | 40 to 50 | VOCs; 1,4-D | VC exceeds NADC. |
| MW0037 | 25 to 35 | VOCs | cDCE (GCTL) and VC (NADC) exceedances. Provides downgradient monitoring of northern plume. |
| MW0039 | 25 to 35 | VOCs | VC exceedance (GCTL) and on far west boundary. Provides downgradient monitoring of southern plume. |
| MW0040 | 65 to 75 | VOCs | Deep well near source zone. |
| MW0041* | 30 to 40 | VOCs | VC exceeds NADC. |
| MW0042* | 35 to 45 | VOCs | VC exceeds 10XNADC. |

*Proposed monitoring wells.
1,4-D = 1,4-dioxane.
Annual sampling, conducted in November (timing may be adjusted based on SZ treatment).

6770 South Washington Avenue, Suite 3

Titusville, FL 32780

**Table 1. Summary of DPT Sample Spacing Compared to Recommended Spacing**
**Contractor's Road Heavy Equipment Area**

| Location | Applicable Maps | Plume Concentration | Recommended EE Guidance Spacing | Actual Sample Spacing | Rationale |
|---|---|---|---|---|---|
| DPT0135 | VC 31 to 46 | HS | 25 ft | 30 to 40 ft | Subsurface utilities present in this area. |
| DPT0159 | VC 16 to 30 | HCP | 50 ft | 50 to 100 ft | DPT0347 provides adequate delineation of this HCP. |
| DPT0161 | VC 16 to 30; VC 31 to 46 | HS | 25 ft | 25 to 45 ft | The area between DPT0161 and DPT0178 is inaccessible due to a drainage ditch. |
| DPT0237 | VC 31 to 46 | HS | 25 ft | 25 to 65 ft | The area between DPT0237 and DPT0149 is inaccessible due to a drainage ditch. |
| DPT0251 | VC 16 to 30; VC 31 to 46 | HCP | 50 ft | 35 to 90 ft | There is very thick road base in this area to support movement of heavy equipment and refusal was repeatedly encountered (attempted at over 20 locations). |
| DPT0268 | VC 31 to 46; VC 46 to 56 | HS | 25 ft | 25 to 50 ft | Railroad tracks are present in this area. |
| DPT0291 | cDCE 31 to 46; cDCE 46 to 56; VC 31 to 46; VC 46 to 56 | HS | 25 ft | 25 to 50 ft | The area between DPT0291 and DPT0290 was inaccessible during multiple sampling events due to standing water. |
| DPT0311 | cDCE 31 to 46; cDCE 46 to 56; cDCE >56; VC 31 to 46; VC 46 to 56; VC >56 | HS | 25 ft | 25 to 50 ft | The area between DPT0311 and DPT0332 was inaccessible during multiple sampling events due to standing water. |
| DPT0318 | VC 31 to 46 | HS | 25 ft | 25 to 70 ft | The area between DPT0318 and DPT0329 is inaccessible due to standing water, a drainage ditch, and railroad tracks. The areas to the north and south of DPT0318 were inaccessible during multiple sampling events due to standing water. |
| DPT0331 | VC 31 to 46 | HS | 25 ft | 25 to 50 ft | Limited access due to heavy vegetation. |
| DPT0333 | VC 16 to 30; VC 31 to 46; VC 46 to 56 | LCP | 100 ft | 65 to 130 ft | Limited access due to heavy vegetation. |

Note: This table is intended to provide additional explanation where sample spacing varied from suggested guidance.

**Legend**

- DPT Sampling Location
- Intermediate Monitoring Well Location showing screen interval (ft BLS)
- Cleared Paths
- Hot Spot 1

| Parameter | Abbreviation | GCTL | NADC |
|---|---|---|---|
| Tetrachloroethene | PCE | 3 | 300 |
| Trichloroethene | TCE | 3 | 300 |
| cis-1,2-Dichloroethene | cDCE | 70 | 700 |
| trans-1,2-Dichloroethene | tDCE | 100 | 1,000 |
| 1,1-Dichloroethane | 1,1-DCA | 70 | 700 |
| Vinyl Chloride | VC | 1 | 100 |

Notes:
1. Screen interval is presented in feet below land surface (ft BLS).
2. Results are presented in micrograms per liter (µg/L).
3. I indicates result is between the method detection limit and the practical quantitation limit.
4. J indicates estimated value.
5. U indicates value was not detected above the method detection limit.
6. L indicates value exceeds the calibration range.
7. Yellow shaded, bold text indicates exceedance of Florida Department of Environmental Protection (FDEP) Groundwater Cleanup Target Level (GCTL).
8. Orange shaded, bold text indicates exceedance of FDEP Natural Attenuation Default Concentration (NADC).

- DPT Location Not Sampled in this Interval

**DPT Sampling Location showing (highest TCE Concentration)**

- TCE concentration less than or equal to 3 µg/L
- TCE concentration greater than 3 µg/L (GCTL)
- TCE concentration greater than 300 µg/L (NADC)

**Monitoring Well Location showing (screen interval (ft BLS) and [TCE Concentration])**

- TCE concentration less than or equal to 3 µg/L
- TCE concentration greater than 3 µg/L (GCTL)
- TCE concentration greater than 300 µg/L (NADC)
- 3 µg/L TCE Isopleth
- Hot Spot 1
- Hot Spot 2
- Cleared Trails

Notes:
1. ft BLS indicates feet below land surface.
2. Results are presented in micrograms per liter (µg/L).
3. TCE indicates trichloroethene.
4. I indicates reported value is between the method detection limit and the practical quantitation limit.
5. U indicates value was not detected above the method detection limit.
6. GCTL indidcates Groundwater Cleanup Target Level.
7. NADC indicates Natural Attenuation Default Concentration.
8. Prefix for all sampling locations is "CRHE-".
9. Contours that are based solely on non-detects with elevated detection limits are shown with dashed lines and no shading.
10. Only monitoring wells that were sampled in March 2012 & December 2013 are shown on this map.

# MEMORANDUM

| | |
|---|---|
| Date: | 22 April 2015 |
| To: | Anne Chrest |
| Copies to: | NASA Remediation Team |
| From: | Lane Dorman, P.G. and Jim Langenbach, P.E. |
| Subject: | Contractor's Road Heavy Equipment Area (CRHE) (SWMU055)<br>Step 1A/1B Engineering Evaluations – Response to Comments |

---

Comments on the CRHE Step 1A/1B Engineering Evaluations have been reviewed and responses, where applicable, are provided below. The comment is provided and Geosyntec's response, in italics, is below the comment.

**Tetra Tech Comments:**

**Step 1A:**
**Technical Comments**

1. Slide 12
   Suggest showing the site conditions for the HS2 area, as photos show conditions of HS1.

   *Response: Comment noted; pictures of HS2 included.*

2. Slide 14
   Is the lithologic unit present from approximately 48 to 78 feet bls a continuous silty sand with clay unit? Suggest showing any details that may relate to confining/semi-confining conditions, as a relatively thin unit with higher clay content is typically present where the top of this layer is depicted (global to cross sections).

   *Response: Comment noted; see revised cross section notes.*

3. Slide 38
   [a] Should the LCP plume be shown as inferred south of DPT0044,
   [b] west of DPT0146/0220,
   [c] east of DPT0135? Samples were not collected from this interval at those locations.
   [d] Additionally, the DPT spacing around DPT0336 does not appear to meet KSC spacing conventions.

[e] For consistency, the LCP should be extended to include DPT0179 (e.g., DPT0162 was included).

*Response:*
*[a] Geosyntec does not agree that the LCP should be shown as inferred S of DPT0044. The distance between DPT0060 and DPT0065, which both had VC concentrations below 2.0 µg/L in this mapping interval, is approximately 120 ft. Based on the VC concentrations at DPT0060 and DPT0065 and at the following locations, the LCP is delineated in this area:*

- *31-35 ft BLS interval from DPT0044 (2.3 µg/L),*
- *31-35 ft BLS interval from DPT0014 (0.80 U µg/L), and*
- *26-30 ft BLS interval from DPT0011 (0.80 U µg/L).*

*The VC 16-30 ft BLS plume map has been revised to show VC concentrations from the 31-35 ft BLS intervals of DPT0044 and DPT0014 for lateral delineation interpretation.*

*[b] Geosyntec does not agree that the LCP should be shown as inferred W of DPT0146/220 based on the VC concentration in the 36-40 ft BLS interval from DPT0325 (0.26 U µg/L).*

*[c] Geosyntec does not agree that the LCP should be shown as inferred W of DPT0135 based on the VC concentration in the 36-40 ft BLS interval from DPT0323 (0.26 U µg/L). The VC 16-30 ft BLS plume map has been revised to show VC concentrations from the 36-40 ft BLS intervals of DPT0323 for lateral delineation interpretation.*

*[d] Comment noted; although DPT spacing around DPT0336 shown on the 16-30 ft BLS interval map does not meet the specific spacing suggestion in the Step process, VC detections at DPT0337 (17.7 µg/L) and DPT0345 (1.1 µg/L) from the 31-35 ft BLS interval (i.e. the interval immediately below the 1,500 µg/L VC detection in DPT0336) indicate that the current contour interpretation is valid. The VC 16-30 ft BLS plume map has been revised to show VC concentrations from the 31-35 ft BLS intervals of DPT0337 and DPT0345 for lateral delineation interpretation. If an interim measure is necessary in this area, additional sampling may be completed at that time.*

*[e] Comment noted; the VC 16-30 ft BLS plume map was adjusted slightly to include DPT0179 and DPT0165 in the 1.0 µg/L contour; however, this does not represent a material impact to the LCP.*

4. Slide 39
[a] Suggest showing LCP as inferred in the northeast most portion of the LCP northeast of DPT005, as there are not points bounding the plume in this direction between DPT0182 and DPT0077.
[b] Please also identify the area south of MW0034 as a data gap, as the HCP is not delineated to the south of this location.

*Response:*
*[a] Geosyntec's contour interpretation of the peripheral DPT locations in this area is based on observed VC concentrations less than 1.0 µg/L in DPT0181, DPT0182, DPT0077, and DPT0013.*

*[b] Comment noted. Geosyntec agrees that there is not a DPT location that meets the specific spacing suggestion in the Step process south of MW0034. However, given the VC concentrations detected in DPT0307 (31.6 µg/L) and DPT0308 (70.9 µg/L), we are comfortable with the delineation as presented. Sampling in this area has not occurred to date due to wetland conditions. If accessible, additional sampling may be conducted at a later date, if needed.*

5. Slide 40
[a] The HCP is not bound in the northern direction of DPT0301 and DPT0302 to the north and northwest. Suggest more conservative contouring in this area as well as identification of data gap.

[b] We also suggest south of DPT0350 and IW0020I be identified as an HCP data gap, as data is not available in this direction near the referenced locations.

*Response:*
*[a] Geosyntec agrees that there is a data gap at this location when comparing to the specific spacing suggestions in the Step process; however, this data gap can be filled at a later date, if needed. The VC 46-56 ft BLS plume map has been updated with more conservative contouring.*

*[b] Geosyntec agrees that there is not a DPT location that meets the specific spacing suggestion in the Step process in this area of the 46-56 ft BLS mapping interval; however, based on the VC detections in the 41-45 ft BLS interval at DPT0288 (40.6 µg/L) and 46-50 ft BLS interval at DPT0010 (48.4 µg/L), we are comfortable with the delineation as presented.*

6. Slide 40
Agree with inferred plume boundary along southwestern tail near DPT0163. Suggest plume boundaries be shown as inferred boundaries near DPT0264 and around DPT0016 (northern isolated detection)?

*Response: Comment noted; plume boundary near DPT0264 and around DPT0016 shown as inferred.*

7. Slide 40
   The LCP south of the Hot Spot 1 area appears to not be delineated, as the plume south of DPT0091 and DPT0095 is not bound to the south by single-digit detections.

   *Response: DPT0110 meets the spacing requirements of S of DPT0091 and our request to collect a sample S of DPT0095 was denied due to utilities. Based on the results at DPT0110 and our understanding of the conceptual site model, we are comfortable with the delineation presented.*

8. Slide 53
   Please list mass information by COC for each plume interval (e.g., X lbs of VC in LCP, Y lbs of VC in HCP, and Z lbs of VC in HS, etc.).

   *Response: The mass evaluation was prepared consistent with the Step 1 requirements; however, COC mass by plume intervals are provided for review.*

**Jacobs**

We reviewed the CRHE Step 1 EE data package. It meets all of the Step 1 EE objectives; the data collected delineates HS2/HCP/LCP adequately and the technology evaluation is complete. Please consider the comments below.

1) Figure 10
   For locations that have 2 sample dates (i.e., DPT0105), which dataset is included in the tag box?

   *Response: Each sample date is included in the tag box. Multiple sampling dates at the same locations were employed to collect samples from intervals that had not been sampled.*

2) Slide 31 (Figure 18)
   a) According to Figure 13, the TCE result of 3.6 µg/L at DPT0227 is from the 46-50 ft bls interval, not "greater than 56 ft bls". No data is shown for DPT0227 past the 46-50 ft bls interval on Figure 13, so it appears that it should be "gray" on Figure 18.

      *Response: Comment noted; Figure 13 has been updated.*

   b) It is understood that "note #8" on this figure explains that the data shown is from the bottom depth interval for each location. However, consider showing the highest result from the intervals sampled below 56 ft bls. In this case, for a location like DPT0244, which had two depths sampled below 56 ft bls (56-60 ft bls and 66-70 ft bls), the TCE data from the 56-60 ft bls interval would be shown (11 µg/L) and would be part of the 3

µg/L isopleth. Currently, the figure shows the TCE data (0.74 µg/L) for the lowest interval (66-70 ft bls) and is, therefore, not part of the 3 µg/L isopleth.

*Response: Comment noted; the objective of this figure is to show vertical delineation. If the highest detection in this mapping interval is shown, it may give the impression that delineation has not been achieved.*

3) Slide 36 (Figure 23)
It is understood that "note #8" on this figure explains that the data shown is from the bottom depth interval for each location. However, consider showing the highest result from the intervals sampled below 56 ft bls. In this case, for a location like DPT0244, which had two depths sampled below 56 ft bls (56-60 ft bls and 66-70 ft bls), the cDCE data from the 56-60 ft bls interval would be shown (110 µg/L) and would be part of the 70 µg/L isopleth. Currently, the figure shows the cDCE data (7.4 µg/L) for the lowest interval (66-70 ft bls) and is, therefore, not part of the 70 µg/L isopleth.

*Response: See response 2b.*

4) Slide 41 (Figure 28)
It is understood that "note #10" on this figure explains that the data shown is from the bottom depth interval for each location. However, consider showing the highest result from the intervals sampled below 56 ft bls. In this case, for a location like DPT0244, which had two depths sampled below 56 ft bls (56-60 ft bls and 66-70 ft bls), the VC data from the 56-60 ft bls interval would be shown (10 µg/L) and would be part of the 1 µg/L isopleth. Currently, the figure shows the VC data 0.58 µg/L) for the lowest interval (66-70 ft bls) and is, therefore, not part of the 1 µg/L isopleth.

*Response: See response 2b.*

# APPENDIX G

**Notes**:
1. µg/L indicates micrograms per liter.
2. ft BLS indicates feet below land surface.
3. U indicates not detected above method detection limit.
4. J indicates estimated value.
5. I indicates result is between the method detection limit and the practical quantitation limit.
6. L indicates value exceeds calibration range.
7. Dashes indicates not analyzed.
8. FDEP indicates Florida Department of Environmental Protection.
9. Bold indicates analyte detected above the FDEP Groundwater Cleanup Target Level (GCTL).
10. Shading and bold denotes greater than the FDEP Natural Attenuation Default Concentration (NADC).

# APPENDIX H

# SUMMARY OF MONITORING WELL SAMPLING RESULTS

**Monitoring Well Sampling Results - VOCs**

**Notes**:
1. Results are shown in units of micrograms per liter (µg/L).
2. ft BLS indicates feet below land surface.
3. U indicates not detected above method detection limit.
4. J indicates estimated value.
5. I indicates result is between the method detection limit and the practical quantitation limit.
6. FDEP indicates Florida Department of Environmental Protection.
7. Bold indicates analyte detected above the FDEP Groundwater Cleanup Target Level (GCTL).
8. Shading and bold denotes greater than FDEP Natural Attenuation Default Concentration (NADC).
9. Dashes indicate no data available.

# APPENDIX I

# INTERIM LAND USE CONTROL IMPLEMENTATION PLAN

# INTERIM LAND USE CONTROL IMPLEMENTATION PLAN

## NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
## KENNEDY SPACE CENTER
## BREVARD COUNTY, FLORIDA

| | |
|---|---|
| FACILITY: | Contractors Road Heavy Equipment (CRHE) Area<br>Solid Waste Management Unit 055 |
| CONTAMINANTS: | Volatile Organic Compounds in groundwater |
| CONTROL: | Prevent contact with groundwater |

### PURPOSE OF LAND USE CONTROL IMPLEMENTATION PLAN

This Interim Land Use Control Implementation Plan (LUCIP) has been prepared to inform current and potential future users of the Kennedy Space Center (KSC) Contractors Road Heavy Equipment (CRHE) Area (SWMU 055; "the Site") of institutional controls that have been implemented at the Site[1]. Although there are no current unacceptable risks to human health or the environment associated with the CRHE Area, an interim institutional land use control (LUC) is necessary to prevent human health exposure to volatile organic compound (VOC)-affected groundwater at the Site. Controls will include periodic inspection, condition certification, and agency notification.

### WHY LAND USE CONTROLS ARE NEEDED

VOCs have been identified in groundwater at the Site above applicable Florida Department of Environmental Protection (FDEP) Groundwater Cleanup Target Level (GCTL) and Natural Attenuation Default Concentration (NADC) screening criteria.

### SITE DESCRIPTION

The CRHE Area is a group of NASA-operated facilities that includes the Printed Circuit Board Shop (PCBS-SWMU No. 31) and associated Acid Dump Site (SWMU No. 15); Sewage Treatment Plant (STP) No. 15 (SWMU No. 16); a polishing pond on the eastern edge of the SWMU boundary; a fenced area at the north end of the SWMU boundary where sandblasting and painting operations took place in the past; and Heavy Equipment Area buildings and parking areas south of the PCBS (SWMU No. 055). The CRHE Area buildings and parking areas have been used for a variety of operations including heavy equipment storage and maintenance dating back to the construction of NASA's Vehicle Assembly Building (VAB), and for staging of regulated and hazardous waste. Currently, the area is used

[1] *This LUCIP summarizes institutional controls regarding the NASA CRHE. For detailed information on the Site, consult the CRHE administrative file, which is available for review by contacting the KSC Environmental Assurance Branch at telephone number (321) 867-8402.*

for heavy equipment storage and maintenance. Hazardous wastes are no longer stored on site.

The PCBS facility has been used for manufacturing printed circuit boards, silk screening, plating, and laminating road signs. Spent chemicals from the circuit board process were temporarily stored in an underground storage tank (UST) located immediately east of the PCBS. The UST ruptured during removal on August 7, 1990 and the location was identified as the Acid Dump Site in a subsequent report. In addition, printed circuit board rinsate water and equipment cooling water were discharged to a hole or drum in a wetland area immediately east of STP No. 15. Printed circuit board manufacturing operations have been discontinued; however, some "closed-loop" plating operations are ongoing. A hazardous waste staging area structure that currently is only used for non-regulated waste is located adjacent to the PCBS building K6-1996.

The STP No. 15 and Polishing Pond were used for treatment of domestic wastewater from the PCBS building and the office building north of the PCBS. Wastewater was reportedly discharged to STP No. 15 from November 1971 until July 1986 when domestic wastes that this unit would have treated were redirected to STP No. 4, which serves the VAB area. From July 1986 to October 1996, STP No. 15 served as a grease treatment plant, where grease collected from grease traps was brought for biological treatment. In October 1996 STP 15 was abandoned.

## SITE LOCATION

The CRHE Area is located at KSC on Contractors Road approximately 0.5 mile north of the intersection with Schwartz Road (Figure 1). The CRHE Area is about 1,100 by 1,350 feet.

The site is bounded on the north and east by woodlands, on the south by KSC's Roads and Grounds Facility, and on the west by Contractors Road and woods. The site is located within Section 18 of Township 22 South, Range 37 East, which is in the Orsino Quadrangle. Survey coordinates in the State Plane Coordinate System North American Datum (NAD) 1983 meters, Florida East for the corners of the groundwater use control area are shown on Figure 2.

## SITE CONTAMINATION AND CONTROL

Groundwater contaminated with VOCs at concentrations over FDEP GCTLs are currently being monitored to assure that off site migration does not occur and contaminants are naturally attenuating. LUCs are therefore required to prohibit groundwater use at the site. Potential for effects on indoor air quality shall be evaluated prior to any construction within the groundwater use control area.

## DECISION DOCUMENT

The KSCRT determined that institutional controls should be implemented at the CRHE Area. A Statement of Basis (SB) establishes institutional controls as a component of the remedy for this site. The institutional controls are temporary while long term monitoring documents the reduction of VOCs through natural processes.

## IMPLEMENTATION

Institutional controls will be implemented by the KSC Environmental Assurance Branch in accordance with their RCRA permit and a

Land Use Control Assurance Plan included in the Memorandum of Agreement (MOA)[2] between NASA and the FDEP, effective February 23, 2001. Upon approval of this Interim LUCIP, it will be incorporated into the permit by reference. Property transfer (if conducted in the future) will be conducted in accordance with Section X of the MOA.

KSC's Environmental Assurance Branch will provide KSC's Master Planning Office with survey coordinates of the LUCs. Restrictions will specify limitations on development and reuse for the area for as long as LUCs are necessary to protect human health and the environment.

**MONITORING**

Quarterly inspections to monitor that the LUCs specified herein are in place and operating will be conducted by KSC's Environmental Assurance Branch. The inspections will verify that no groundwater use is occurring.

**REPORTING**

KSC's Environmental Assurance Branch will submit annual reports to FDEP certifying retention of the LUCs.

**ENFORCEMENT**

KSC's Environmental Assurance Branch will be responsible for stopping any activities that are not compliant with this LUCIP.

**MAINTENANCE**

The Interim LUCIP shall remain in place until the scenarios managed by the LUCIP are no longer a concern.

*[2] By separate MOA effective February 23, 2001, with the FDEP and KSC, on behalf of NASA, agreed to implement Center-wide, certain periodic site inspections, condition certification, and agency notification procedures designed to ensure the maintenance by Center personnel of any site-specific LUCs deemed necessary for future protection of human health and the environment. A fundamental premise underlying execution of that agreement was that through the Center's substantial good faith compliance with the procedures called for herein, reasonable assurances would be provided to the FDEP as to the permanency of those remedies which included the use of specific LUCs.*

*Although the terms and conditions of the MOA are not specifically incorporated or made enforceable herein by reference, it is understood and agreed by NASA KSC and FDEP that the contemplated permanence of the remedy reflected herein shall be dependent upon the Center's substantial good faith compliance with the specific LUC maintenance commitments reflected herein. Should such compliance not occur or should the MOA be terminated, it is understood that the protectiveness of the remedy concurred in may be reconsidered and that additional measures may need to be taken to adequately ensure necessary future protection of human health and the environment.*

# DAILY LOGS

Geosyntec consultants

**DAILY FIELD REPORT**

Project: FR1681 CRHEA
Project No.: FR1681
Date: 6/22/09
Task No.:
Contractors: EDS- Chris Phelps & Keith Olson; KB Labs - Herb Kelley

**Work Performed**

Well Installation:
Soil Borings:
DPT: X
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

**Observations/Issues of Concern**

Call Duty office ok to dig. Calibrate and load equipment.
0630 Arrive at office.
0800 Meet EDS & KB Labs at badging station.
0830 On site, Call Security, Utility locate is being completed.
0845 Hand auger Location A (DPT0017) To 5'. Sample at 8-12', 16-20', 26-30', & 36-40'.
1000 Leave site to get spill pallet for decon ing.
1030 Back on site, Decon rods & continue sampling DPT0017 at 41-45', 46-50' and 61-65'
1145 Lunch Break
1230 On site. Decon rods. Hand auger Location B (DPT0018) and Sample at 8-12', 16-20', 26-30', 36-40', 41-45', 46-50' and 61-65'.
1445 Decon Rods.
1500 Take air conditioning break due to slight heat stress.
1515 Trimmy grout DPT0017.
1545 Hand auger location C (DPT0019) To 5'. Sample at 10', 18', 28' 38' 43' 48' and 63'. Trimmy grout.
1800 Load equipment. Dispose of IDW at CCF.
1830 Leave site.

## DAILY FIELD REPORT

PROJECT: NASA CRHF

LOCATION: CAPE CANAVERAL, FL PROJECT NO.: FR1681 TASK NO: 3.0

DESCRIPTION: DPT GW SAMPLING DATE: 6/23/09

CONTRACTOR: EOS → CHRIS, KEITH; RB LABS - TUAN

WEATHER: OVERCAST, ~80°F, WIND FROM WEST < 5MPH

| | |
|---|---|
| 645 | ARRIVE TO OFFICE, ALEX RIVERA, CHECK IN W/SAM BARFUS / BEGIN CALIBRATION OF GW EQUIPMENT / LOAD EQUIPMENT INTO VEHICLE |
| 715 | ARRIVE AT BADGING STATION TO OBTAIN BADGE |
| 730 | MOBILIZE TO RSC, FL → CONTRACTOR'S ROAD, CRHF FACILITY |
| 800 | EOS AND MOBILAB ONSITE → EOS BEGINS TRIMM GROUTING OF DPT-18 / DISCUSS PLAN - CONTACTS W/ J.B. |
| 830 | COMPLETE GROUTING OF DPT-18 → MOBILIZE TO DPT-20 / HAND AUGER TO 5 FT BLS |
| 850 | DPT-20 - PURGE INTERVAL 8-12' BLS @ LOW FLOW TO AVOID RECHARGE |
| 914 | COMPLETE PURGE - SAMPLE DPT-20 (8-12') / PURGED ~0.50 GAL |
| 920 | BEGIN DPT TO 20 FT BLS |
| 926 | PURGE DPT-20 (16-20') / PURGE ~0.50 GAL PRIOR TO SAMPLING |
| 938 | SAMPLE DPT-20 (16-20') / BEGIN DPT TO 30 FBLS |
| 945 | BEGIN PURGE OF DPT 26-30 FT BLS |
| 957 | SAMPLE DPT-20 (26-30) / PURGED ~0.50 GAL PRIOR TO SAMPLING |
| 1007 | REACH DPT-20 (36-40) / BEGIN PURGE |
| 1018 | SAMPLE DPT-20 (36-40) / PURGED ~0.75 GAL PRIOR TO SAMPLING |
| 1020 | DRILLERS MOBILIZE TO DECON STATION TO DECON SCREENS |
| 1030 | CONTINUE DPT TO 45 FT BLS |
| 1040 | BEGIN PURGE OF DPT20 (41-45) |
| 1053 | SAMPLE DPT 20 (41-45) / PARGE ~0.75 GAL. PRIOR TO SAMPLING |
| 1105 | REACH DPT-20 (46-50) / BEGIN PURGE |
| 1119 | SAMPLE DPT-20 (46-50) / PURGED ~0.75 GAL PRIOR TO SAMPLING |
| 1134 | REACH DPT-20 (61-65') / BEGIN INITIAL PURGE |

Call Security - Environmental drilling at CRHE area.
0925 Hand augered to 5' BLS. Photographed 1ft intervals collected on plastic, drummed soil. will Lay out ~20ft rows of soil L-R/~~1~~ ~~2~~ ~~3~~ ~~4~~ ~~5~~ ~~6~~ ~~7~~ ~~8~~ ~~9~~ ~~10~~ ~~11~~ ~~12~~ ~~13~~ ~~14~~ ~~15~~ ~~16~~ ~~17~~ ~~18~~ ~~19~~ ~~20~~ ~~21~~ ~~22~~ ~~23~~ ~~24~~ ~~25~~ ~~26~~ etc. Photos of 2.5' sections Setup plastic under the truck. Drums to 60% - will check on # after 1st hole. Need 3 or ~~more~~ pallets.
12-1230 Lunch ~~with~~ Anne a message - need to drum soil to calc # of drums.
SB0002 and SB0002A had many utilities around. used SB0023 location for "SB0002". Hand augered to 5' BLS. Setup ~~?~~ Complete
6 offsite, RTN to office get addt'l equipment Post hole dig
645 Leave office
~~Tue~~ 11-1230 SB0001 & 2 boring logs in CAD

**Plans/Future Activities**

- Where do we store the drums? / Set up decon?
Just inside fence to North of Bldg 1 / use pan - steam while removing rods.

~ 230 Anne & Bob came by. ~~Confirmed~~ soil Please Leave soil. SB0001 was already drummed.

Project: CRHE Contractors Rd
Project No.: FR1681
Contractors: EDS KB Labs

Date: 3/1/10
Task No.: 07#3

**Work Performed**

Well Installation:
Soil Borings:
DPT: DPT 91 - 93 + 3 intervals of 94
Well Inventory:
Other: Mobile Lab, Utility Locate

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

**Observations/Issues of Concern**

0645 Arrive @ Titusville Office to calibrate YSI & pack equipment
0715 Meet EDS @ badging station & escort them to the CRHE site
0745 Tailgate safety meeting
0800 DPT 91 started. Utility Locate expected @ 1000. Locate while there is time between sampling
0845 Utility locate arrives early. Drillers wait while locate is being conducted.
0945 The final locate at this project phase is complete. ~~DPT~~ DPT resumes
1000 EDS must decon the screens.
1030 DPT 91 finished. Move to DPT 92
1040 DPT 92 started
1125 EDS must decon their screens. Take lunch after
1310 DPT 92 finished. move to DPT 93
1325 DPT 93 started.
1525 DPT 93 finished. Decon their screens before moving to DPT 94. Rebecca would like as many samples today due to bad weather expected tomorrow
1545 DPT 94 started

**Plans/Future Activities**

1635 3 screened intervals finished
EDS collects the IDW + I escort them to the CCC
1705 EDS is escorted off site. Glenn of KB Labs remains on site
1730 Arrive back @ Titusville office to perform CCV of the YSI
1755 End of the day
DPT tomorrow

3/1/10
Signature/Date

Geosyntec consultants

**DAILY FIELD REPORT**

Page 1 of 1

Project: CRHE - Contractors Rd
Project No.: FR1681
Contractors: EDS & KB Labs

Date: 3/2/10
Task No.: 07+3

**Work Performed**

Well Installation:
Soil Borings:
DPT: DPT 94 - 96
Well Inventory:
Other: Mobile Lab

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

**Observations/Issues of Concern**

0645 Arrive @ Titusville office to calibrate YSI & pack equipment
0705 Meet EDS @ loading station & escort them to the job site
0735 conduct daily tail/gate safety meeting
0745 Phase II weather advisory is called as 33' depth is stabilizing. I take pH sample early then get into my vehicle. As does EDS
0830 Phase II over. Resume work on DPT 94
0930 DPT 94 finished. Move to DPT location 95 while deconing the screens
1000 Geopump not working. EDS disassembles it to find out why.
1019 The wire to the battery went bad. They find a replacement & hook it into the pump
1130 ~~1030~~ Decon the screens & take lunch
1230 DPT 95 finished move to DPT 96
1258 DPT 96 started
1440 DPT 96 finished. EDS crew decons equipment before packing up.
1535 Escort EDS to the LCC to dump the IDW.
1535 Escort EDS to their next DPT site @ NASA (CM&S) so they can leave their rig & trailer for tomorrow.

**Plans/Future Activities**

1600 Escort EDS off site & return to Titusville office
1630 Perform YSI CCV
1645 End of the day

**DAILY FIELD REPORT**

Project: CRHE
Project No.: FR1681
Contractors: EDS - David Seaforss + Glen Pennington

Date: 6/14/10
Task No.: 12.7

**Work Performed**

| | | | |
|---|---|---|---|
| Well Installation: | | Sampling Soil: | |
| Soil Borings: | | Sampling SW/Sediment: | |
| DPT: | X | Sampling Monitor Wells: | |
| Well Inventory: | | Sampling Hazardous Waste: | |
| Other: | | Sampling Drums: | |

**Observations/Issues of Concern**

0630 Arrive at office. Calibrate and load equipment.
0730 Meet EDS at badging station. Pick up spill pallet at POL. Travel to site.
0815 On site. Conduct tailgate meeting. Unload equipment.
0845 Hand auger DPT0097 to 5' (Location B on map). Sample at 8-12', 12-16', 16-20', 21-25', 26-30', 31-35', 36-40'. Replace decon water. Sample at 41-45' & 46-50'.
1200 Lunch break
1230 Pressure grout ~~DPT~~ RD DPT0097. Pressure wash rods & screens.
1330 Hand auger DPT0098 (Location A on map) to 5'. Sample at 8-12', 12-16', 18-20', 21-25', 26-30', 31-35', 36-40'. Replace decon water. Sample at 41-45' & 46-50'. Attempt to pressure grout but cannot get grouter started. Trimmey grout hole.
1745 ~~1800~~ JRD Attempt to hand auger location C. Hit what appears

**Plans/Future Activities**

Spill Pallet Bar Code 170407
Drum Bar Code 170408 (DPT0097 - DPT0101)
IDW Disposal - drums on site

Task No.:

## Work Performed

Well Installation:
Soil Borings:
DPT: ✓ Groundwater sampling
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

## Observations/Issues of Concern

0645 Equipment calibration conducted.
0745 J. McKinnon gets badge at NASA badging station; meet EDS.
0825 J. Barfus conducts health and safety meeting with Geosyntec and EDS.
0840 Geosyntec meets with NASA Site personnel.
0850 Barfus off-site. DPT groundwater sampling activities begin.
0900 DPT0116("A") drilling begins. All boreholes will be hand augered to 5 ft bls.
0915 DPT0116-010.0 collected.
0930 DPT0116-018.0 collected.
0950 DPT0116-028.0 collected.
1010 DPT0116-033.0 collected.
1015 EDS decontaminates screens at spill pad.
1030 DPT0116-038.0 collected.
1055 DPT0116-043.0 collected.
1185 DPT0116-048.0 collected.
1125 DPT0116 sampling complete. Mobilization to DPT0117 and screen decontamination conducted.
1130 DPT0117 drilling begins. ("B")

## Plans/Future Activities

DPT groundwater sampling
Sample Depths:
10 = 8-12 ft BLS
18 = 16-20 ft BLS
28 = 26-30 ft BLS
33 = 31-35 ft BLS
38 = 36-40 ft BLS
43 = 41-45 ft BLS
48 = 46-50 ft BLS

**Observations/Issues of Concern**

1335 DPT0120 - 023.0 collected.
1357 DPT0120 - 028.0 collected. Anne (NASA) visited site.
1402 Anne off-site, EDS decontaminates sampling screens.
1415 DPT0120 - 033.0 collected.
1447 DPT0120 - 038.0 collected.
1500 DPT0120 - 043.0 collected.
1523 DPT0120 - 048.0 collected.
1530 DPT0120 sampling activities complete.
1535 EDS mobilizes to DPT021 and decontaminates sampling screens.
1550 DPT0121 drilling begins, at "G" location.
1608 DPT0121 - 010.0 collected.
1620 Grouting to land surface of previous sampling location boreholes complete.
1625 DPT0121 - ~~016.0~~ 014.0 collected.
1640 DPT0121 - 018.0 collected.
1658 DPT0121 - 023.0 collected. EDS disposes of purge water at drum staging area.
1715 Geosyntec and EDS off-site; site secured; no health and safety incidents observed.

**Plans/Future Activities**

DPT groundwater sampling.

Sampling Drums:

Weather: sunny, hot, partly cloudy, light winds

**Observations/Issues of Concern**

0700 EDS on-site; preparation for DPT groundwater sampling with Geoprobe 6620DT track-mounted rig and equipment maintenance conducted.
0712 Geosyntec on-site. EDS decontaminates DPT samplers.
0720 Geosyntec conducts groundwater quality meter calibration.
0735 Geosyntec conducts a health and safety meeting with EDS.
0740 DPT0121 drilling and sampling continues.
0757 DPT0121-028.0 collected.
0817 DPT0121-033.0 collected.
0837 DPT0121-038.0 collected.
0857 DPT0121-043.0 collected.
0920 DPT0121-048.0 collected. EDS decontaminates DPT samplers.
0935 DPT0121 sampling activities complete. Mobilization to DPT0122 ("4") conducted.
0945 DPT0122 drilling activities begin.
1005 DPT0122-010.0 collected.
1020 DPT0122-014.0 collected.
1030 DPT0122-018.0 collected.

**Plans/Future Activities**

DPT groundwater sampling
Sample Depths:
10 = 8-12 ft BLS
14 = 12-16 ft BLS
18 = 16-20 ft BLS
33 = 31-35 ft BLS
38 = 36-40 ft BLS
43 = 41-45 ft BLS
48 = 46-50 ft BLS

**Observations/Issues of Concern**

0630: arrived @ office; met Jan; calibrated YSI & loaded car
0730: met EDS (Davie & JR) @ badging station
0745: arrived on site
0750: conducted tailgate; discussed hazards associated w/ DPT, PPE, scope of work
0815: Rebecca called; wanted to go to AA after A → scratch → go to B after A,
0820: set up @ DPT-0141
0935: Davie went to decon screens
1055: Finished DPT 141; Davie decon'ed ~~screens~~ screen & rods (JA), JR moved to DPT-142
1110: JR began hand augering DPT-142
1200: left site for lunch
1225: returned from lunch
1230: Pete from "utility locate" arrived onsite and investigated @ AA and AB
1235: called Rebecca to confirm where to go next; she requested AA → C → D → 139 → E
1310: Davie decon'ed screens
1423: Finished DPT 142; Davie decon'ed rods and ~~fitte~~ filed threads

~~Plans/Future Activities~~

1440: JR began hand augering DPT-143
1620: Davie decon'ed screens
1651: Finished DPT-143; Davie decon'ed rods & screens; JR moved to DPT-144
1705: JR began hand Augering DPT-144 → took 10' sample
1715: end of day

* completed: 20 samples
DPT 141 → 10', 18', 28', 33', 38', 43', 48'
DPT 142 → 10', 18', 28', 33', 38', 43', 48'
DPT 143 → 28', 33', 38', 43', 48'
DPT 144 → 10'

Project: CRITE
Project No.: ~~FR1686~~ FR1681
Contractors: EDS - Davie & JR KB Labs (Glenn)

Date: 10/13/10
Task No.: 7*4

**Work Performed**

| | | | |
|---|---|---|---|
| Well Installation: | no | Sampling Soil: | no |
| Soil Borings: | no | Sampling SW/Sediment: | no |
| DPT: | yes | Sampling Monitor Wells: | no |
| Well Inventory: | no | Sampling Hazardous Waste: | no |
| Other: | — | Sampling Drums: | no |

**Observations/Issues of Concern**

0630: arrived onsite; calibrated YSI
0700: EDS arrived
0710: conducted tailgate; discussed today's scope; RR safety; drum & IDW disposal
0735: Davie & JR dumped IDW while I supervised; no waste was spilled; bung screw was tightened ~~appropriately~~ appropriately
0745: Davie decon'ed and Filed rods
0750: JR moved to DPT-0147
1005: Finished DPT-0147; Davie decon'ed rods & screens
1030: began DPT-0148 - Davie grouted previous DPT locations
1114: Davie decon'ed screens
1232: finished DPT-0148; Davie decon'ed rods & screens
1240: began mob process
1350: lunch
1400: setup @ DPT-0149
1450: Davie decon'ed screens

**Plans/Future Activities**

1600: finished DPT-0149; Davie decon'ed rods and screen
1620: set up @ DPT-0150
1640: Finished DPT-0150 - 28'
1645: davie decon'ed screen; took purge water to spill pallet; dumped all water
1700: end of day

completed: DPT-147 → 28', 33', 38', 43', 48'
DPT-148 → 10', 18', 28', 33', 38', 43', 48'
DPT-149 → 10', 18', 28', 33', 38', 43', 48'
DPT-150 → 28'

Sampling Drums:

**Observations/Issues of Concern**

0620 - Arrive at TVL office; calibrate YSI
0720 - Arrive on-site; locate staging areas, talk to Dave about decon pit / spill pallet area
0745 - Tailgate safety meeting - COCs, hard hat, heavy equipment
0810 - Speak to a man inside the building where Michael Palmer used to be - he said we can stage our spill pallet near the decon pit
0905 - Begin drilling location A (DPT 0156); 26-30 @ 0924
31-35 @ 0937; 36-40 @ 0949; 41-45 @ 1003; 46-50 @ 1019 decon screens grout
1049 - Begin drilling location B (DPT 0157); 26-30 @ 1106
31-35 @ 1118; 36-40 @ 1230; 41-45 @ 1245; 46-50 @ 1302 decon screens grout
1145 - Took sample of Drums IDW 185534 & 185535
1340 - Begin drilling location C (DPT 0158); 26-30 @ 1347; 31-35 @ 1403
36-40 @ 1420; 41-45 @ 1435; 46-50 @ 1451; decon screens; grout
1542 - Begin drilling location L (DPT 0159); 26-30 @ 1601; 31-35 @ 1613
36-40 @ 1628; 41-45 @ 1644; 46-50 @ 1657; decon screens; grout

**Plans/Future Activities**

*Note: Very close to the KSC highway - only cones are setup as warning
1720 - Leaving site; put decon water in drum 185538

Project: FR1681 - CRTE
Project No.: FR1681
Contractors: Boart Longyear

Date: 12.19.11
Task No.:

**Work Performed**

Well Installation: -
Soil Borings: SB0005
DPT: -
Well Inventory: -
Other: -

Sampling Soil: -
Sampling SW/Sediment: -
Sampling Monitor Wells: -
Sampling Hazardous Waste: -
Sampling Drums: See Drum Log.

**Observations/Issues of Concern**

0850 J. McKinnon (Geosyntec) arrives at Badging Station (KSC-NASA); obtains badge.
0918 Boart Longyear (V. Scott, J. Kiever, J. Smith, S. Conley) arrive; obtain badge.
0930 Mobilization to Contractor's Road Site (CRTE).
0940 Geosyntec conducts a health and safety meeting with Boart Longyear (BL).
0950 Unloading of equipment and preparation for soil boring activities using a sonic rig. Geosyntec checks in with site personnel.
1020 Geosyntec and BL off-site to pick up drum staging platforms
1120 On-site -- mobilize to SB0005.
1200 Geosyntec offsets SB0005 approximately 30 ft NW. S. Conley and BL support truck off-site.
1230 Lunch.
1310 BL fills water truck at CRTE decontamination area.

Sampling Soil: -
Sampling SW/Sediment: -
Sampling Monitor Wells: -
Sampling Hazardous Waste: -
Sampling Drums: See Drum Log

**Observations/Issues of Concern**

1420 NASA locator clears new SB0005 location; off-site.
1430 SB0005 boring installation begins. At each location, BL will hand auger to 5 ft bls, collect a continuous soil core to 80 ft bls, decontaminate drill rod, and place decontamination water, soil cuttings, and drill fluid in 55 gal drums at the approved IDW staging area. Geosyntec will conduct lithology description, photo documentation, documentation, and drilling oversight. See all attached field forms.
1600 SB0005 boring complete. BL fills water tank.
1640 BL pressure grouts from bottom to land surface to abandon SB0005.
1715 SB0005 abandonment complete. De-mobilization and IDW management conducted.
1820 Geosyntec and BL off-site; site secured; no health and safety issues observed.

**Plans/Future Activities**

- Soil borings
- Monitoring well installation

FR1681 - CONTRACTOR'S ROAD 1/9/24

630 ALEX RIVERA (AR) ARRIVES @ BADGING STATION. - MEET W/EMILY LAWSON (EL) TO OBTAIN HASP, DRUM LABELS, ETC.

640 BADGING COMPLETE / AR CONTACTS BRAD WEICHERT (BW) OF KB LABS TO COORDINATE LAB EFFORTS FOR TODAY (SCHEDULED LAB HAS MECH. ISSUES AND WILL NOT BE AVAILABLE UNTIL TUESDAY.) - BW WILL CONTACT AR WHEN ON SITE

- AR REVIEWS LAB / DRILLER WO'S AND SCOPE OF WORK.

700 ENVIRONMENTAL DRILLING SERVICES (EDS) ON SITE - JR (LEAD DRILLER) AND SEAN (HELPER) / ~~ERS~~ MOBS TO OBTAIN DPT RIG (CURRENTLY @ L39B) / AR MOBS TO NOTIFY MIKE PALMER (MP) - NASA PER LAUREN PETTY (LP) REQUEST

- JILL JOHNSON (JJ) CALLS TO UPDATE LAB STATUS. (SEE ABOVE)

720 CHECK IN W/MIKE PALMER - OFFICE HAS RELOCATED TO OSSI 4200B - ~~H~~ 321-861-6253

- AR IDENTIFIES DRUM STAGING / DECON AREA FOR CONTRACTOR'S ROAD.

FRI 6/1 - NASA CRHE

750 EAS @ CROAD. - BEGIN SETUP OF DECON AREA. / AR OBTAINS ICE FOR SAMPLES

835 EAS SETS UP FOR DPT ACTIVITIES / AR REVIEWS HASP W/ STAFF TOPICS INCLUDE HEAT AWARENESS, WILDLIFE BASED ON LOCATION
- AR BEGINS CALIBRATION OF GW EQUIPMENT

840 EAS BEGIN H.A. OF LOCATION DPT 0166 ("M" ON MAP) TO W.T. ~3-4 FT BGS.

900 BEGIN DPT OF 0166 TO 30' BGS. RIG 662 DPT (GEOPROBE), 1.5 IN DIAM. RODS, 4 FT SCREENS (TOTAL OF 5FT) SS WIRE WOUND.

0915 SAMPLE DPT-0166 (26-30) / ADVANCE DPT TO 35' BGS.

0938 SAMPLE DPT-066 (31-35) / ADVANCE DPT TO 40' BGS.

0955 @ DEPTH OF 40' BGS (SCREEN 36-40), LOW VOLUME OF GW EXTRACTED, AR CONTACTS EL., TO DISCUSS, PER E.L., PRIORITY IS COLLECTING SAMPLES, 2ND IMPORTANCE IS WQ PARAMETERS ~~AR~~

1000 SAMPLE DPT-0166 (36-40) - NO WQ PARAMETERS RECORDED. - ADVANCE TO

1020 SAMPLE DPT 0166 (41-45) / ADVANCE DPT TO 50' BGS.

1040 SAMPLE DPT 0166 (46-50) / AR TRANSFERS ALL DPT-066 TO EB LABS FOR ANALYSIS.
- EAS EXTRACTS ALL RODS IN PREPARATION FOR DECON PROCAPURES PRIOR TO MOB TO DPT-0167 / SOIL CUTTINGS INTO BOREHOLE.
(TO GLEN JACKSON)
- APP. 4 GAL OF PURGE/DECON WATER GENERATED @ DPT-0166

1055 EAS DECONS ALL SCREENS USING STEAM WASH @ DECON AREA.

1105 L.P. UPDATED OF DPT ACTIVITIES VIA TEXT / EAS BEGINS H.A. OF DPT-0167 ("N" ON MAP.) TO W.T. ~4 FT BGS.

1134 BEGIN DPT OF 0167 TO 30' BGS.

1148 SAMPLE DPT 0167 (26-30) / ADVANCE DPT TO ~~35~~ 35' BGS.

1204 SAMPLE DPT 0167 (31-35) / ADVANCE DPT TO ~~40~~ 40' BGS.

1230 SAMPLE DPT 0167 (36-40) / ADVANCE DPT TO 45' BGS.

1248 SAMPLE DPT 0167 (41-45) / ADVANCE DPT TO 50' BGS

1307 SAMPLE DPT 0167 (46-48) / AR TRANSFERS ALL DPT-0167 TO G.S (EB LABS)

- EDB EXTRACTS ALL RODS IN PREPARATION FOR DECONTAMINATION PROCEDURES.

1313 EDB MOBS TO DECON AREA / AR UPDATES L.P. OF STATUS OF SAMPLING

- APP. 3.5 GAL OF PARGE / DECON WATER GENERATED FROM DPT-0169

- SOIL CUTTINGS (FROM H.A.) PLACED INTO BOREHOLE

1340 EDB RETURNS TO WORK AREA / H.A. TO WT. @ DPT-0168 ("0" ON FIGURE)

1345 BEGIN DPT OF 0168 TO 30' BGS

1355 SAMPLE DPT-0168 (26-30) / ADVANCE DPT TO 35' BGS.

1412 SAMPLE DPT-0168 (31-35) / ADVANCE DPT TO 40' BGS.

1432 SAMPLE DPT-0168 (36-40) / ADVANCE DPT TO 45' BGS.

1450 SAMPLE DPT-0168 (41-45) / ADVANCE DPT TO 50' BGS.

1512 SAMPLE DPT-0168 (46-50)

1515 AR TRANSFERS ALL DPT-0168 SAMPLES TO KB LABS (GJ.) / EDB EXTRACTS ALL RODS IN PREP. FOR MOB TO NEXT LOCATION

- EDB MOBS TO DECON AREA FOR PRESSURE WASH OF ALL TOOLING / SOIL CUTTINGS INTO BORE HOLE

- AR MOBS TO LOCATE ACCESS TO DPT-0169

FR16E1 NASA CRHE

1/9

1530 EDB SETS UP DPT RIG @ DPT-0169 ("K" ON FIGURE) / JR TO H.A. DPT-0169 TO WT (~4 FT BGS)

1605 EDB RETURNS TO DPT-0169 LOCATION

1610 BEGIN DPT OF 0169 (26-30)

1620 SAMPLE DPT 0169 (26-30) / ADVANCE DPT TO 35 FT BGS

1632 SAMPLE DPT 0169 (31-35) / ADVANCE DPT TO 40 FT BGS

1646 SAMPLE DPT 0169 (36-40) / ADVANCE DPT TO 45 FT BGS

1704 SAMPLE DPT-0169 (41-45) / ADVANCE DPT TO 50 FT BGS.

1718 SAMPLE DPT 0169 (46-50) / SAMPLES TRANSFERRED TO KB LABS (GJ.)

1725 ALL RODS EXTRACTED BY EDB / EDB MOBS TO DECON AREA TO DECON SCREENS USING PRESSURE WASH AND REMOVE LIQUIDS FROM DECON PIT

## Observations/Issues of Concern

06:00 CS (Geosyntec) arrives at Geosyntec Titusville office.
06:38 CS Arrives at NASA KSC Badging office.
07:01 CS, Scott + Nick (GPI) on-site at CRITE de-con area.
07:08 CS conducts Health and Safety Tailgate Meeting
GPI constructs de-con pit.
07:51 Bob (KB Labs) drops off sample bottles, cooler
GPI de-conning screens and rods.
09:10 Drilling commences at location DPT0159.
10:00 Drilling/Sampling completed at location DPT0159.
10:12 CS, GPI re-locate to Location DPT0161.
11:00 Drilling/Sampling completed at location DPT0161.
11:09 GPI re-located to de-con pit for de-con, then to the POL to pick up a spill pallet, then lunch break.
11:15 CS takes lunch break, off-site to NASA cafeteria
12:21 CS returns from Lunch break.
CS meets GPI at de-con pit.
12:35 Spill pallet moved to drum staging area.
13:06 Drilling commences at location DPT0167

**Observations/Issues of Concern**

0900 Meet Drillers at badging station, GPE Drillers are Bryan Nazworth driller; Ben Yarema assistant. Mob to site
0913 Review drum staging area; drillers decon & prep equip.
932 Begin ~~Drilling~~ drilling mw38.
944 drilling mw38 complete; begin set, sand & seal.
951 mw38 complete (except surface completion); Begin drilling mw39.
1010 Drilling mw39 complete; Begin set, Sand & Seal.
1033 mw39 complete. Mob to drum staging area to ~~decon~~ pms
Set up decon pit & decon drive casing.
1040 Arrive ~~decon~~ drum staging area. Erica Williams of Innovative Health Applications (IHA) is @ Drum staging area ~~to~~ Inventorying drums to be Disposed of. Williams points out that one of the drums is Leaking and informs me that she has contacted the fire department ~~for~~ to respond to haz. mat.

0750: Continued DPT0188 (38, 43, 58)
0900: finished DPT0188; deconned
0925: moved to V8 (DPT0174), started ~~DPT0189~~ 0174
0955: low yield - took just sample for ~~DPT0189~~ 0174 (53)
Tried 3 different tubing attempts before sample, possible clay layer
1025: finished DPT0189; moved to A (DPT0190)
1158: finished DPT0190; moved rig to F; deconned
1210: lunch; EDS working on getting rig out of wet ground
1305: Started DPT0190 (F)
1405: Safety person arrived on site. Informed Geosyntec all vehicles must be 2' off of roadways
1406: Safety person left.

**Plans/Future Activities**

1445: Finished DPT0191; moved to V16 (DPT0192) 0149
1450: Started DPT0192 0149
1525: Finished DPT0149 ~~deconned~~
1535: Moved to B (DPT0189), started DPT0189 (18, 23)
1600: Decon
1620: Continued DPT0189 (28, 33, 38, 43, 58)

Soil Borings:
DPT: DPT0194-0195, 0044, 0171, 0155
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

## Observations/Issues of Concern

615-arrive@ office + begin calibrating YSI.
700-arrive on site. tail gate safety meeting.
710-rig won't start. go investigate standing water in woods while drillers work on rig.
910: rig still not starting. go take pictures of source area for Jill.
900 - Drillers leave to pick up part.
1036- drillers arrive w/part.
1040- rig is running
1106- began sampling DPT0194 (V11)*
1210- began sampling DPT0195 (V5)* (pressure grouted)
1329- began sampling DPT0044 (V12)*
1454- began sampling DPT0155 (V14)*
1512- lost extendable point in ground @ DPT0171.
1559- began sampling DPT0171 (V15)*.
1715- began sampling DPT0197 (V3)*. (pressure grouted)

## Plans/Future Activities

1800- ~~dist~~ Rod rods broke down decon pit.
1930- disposed of IDW in drum
1930- sampled drum 190515 @ 1930
1945- left site
* = see sampling forms for details

**Observations/Issues of Concern**

| | |
|---|---|
| 0730 | CT meets Celeste with New Age Labs at Badging office. |
| 0740 | CT/Celeste go to CCF to park Mobile lab |
| 0800 | CT/EDS on site at CRHE/Drillers set up decon pit/Safety Briefing COCs, PPE, Traffic Control Utilities Phase I/II warnings |
| 0810 | Locators (Jeff/Ryan) on site. Notified me of no dig restriction in place for Cat 1, 4, 5. |
| 0832 | Call Lauren Petty to inform of no dig ~~and file~~ |
| 0835 | Speak with locators about any possibility of digging. Ryan says they can give special clearance to dig at locations east of building. No dig in place for location near ROW until Wed (if launch on Tues goes as planned). |
| 0838 | Call K.P. Ask if ok to begin with locations Y, Z, AA. Says yes |
| 0858 | Begin calibration |
| 0915 | Begin DPT0196 at Y. Meet refusal at 16" |

**Plans/Future Activities**

| | |
|---|---|
| | Locators give permission to punch through |
| 0920 | Locators can't approve locations A, B, C, E, G due to utilities/force main |
| 0924 | Call KP to inform. Says to contact her when drilling locations D and I. May need to vertically delineate |

Project: CRTE
Project No.: FR11681
Contractors:

Date: 3/18/13
Task No.: 25x2

**Work Performed**

Well Installation:
Soil Borings:
DPT: 0196(Z) 0197(Y) 0198(AA)
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

**Observations/Issues of Concern**

0930 Continue DPT0196 at Y. Rig will not penetrate beyond 6". Abandon location.
0940 Begin DPT0196 at Z.
1008 Celeste drives on site. Says lab will be ready to analyze around 1400. Takes 4 hrs to warm up and she just got it hooked up.
1110 Call Locator Ryan to ask if location Y can be moved 3' W of approved location. He says "Yes as long as no lines are marked." No lines are marked w/in ~10'.
1134 L.P. called to ask why locations A-D,F,G were not going to be drilled. Told her D, F, G were good to go. Locators approved. A-C are located b/t the main electrical and water main. She says locators also told her vibrations from rig could bust(CT) compromise water main. LP says to delineate F vertically instead of D.

**Plans/Future Activities**

1200 Finish DPT0196 at Z / Drillers decon
1210 Break for lunch
1240 Begin DPT0197 at Y. Moved Y 3' due W of original location.
1422 Celeste picks up samples. We discuss delivering reports via email. She doesn't have internet connection. Checked with someone inside CRTE Building on accessing wifi. He will look into it

0630 Get materials at Titusville office, get badge + mobe to site.
0715 Meet drillers. Need to get strap for pallet + give drillers back. Check woods for accessibility + point them there. Will need mat to cross mud. Prepping to set up on DPT 0226. Calibrate PID + YSI. PID 0/100 ppm isobutylene
0805 Conduct H+S briefing then begin hand augering DPT 0226.
0845 PID reading 0.0 ppm at DPT 0226. Will screen ~~Qual + report~~ QA/QC + approx overages + stop.
1100 Pull off DPT 0226 + move to DPT 0227 (A0 on map). Decon equipment.
1350 Pull off DPT 0227 + move to DPT 0228 (A11 on map). Decon equipment.
1615 Pull off DPT 0228 + move to DPT 0229 (A11 on map). Decon equipment.
1651 Collect CRHE-DPT0229-010.0-20130401 sample + deliver to mobile lab at CCE. Transfer purge water to drums + secure spill pallet. Rig left at DPT 0229 location to resume in morning. Air at 0.0 ppm all day.
1720 Walk woods w/ driller to determine feasible DPT access.
1745 Depart site. Contact L. Puffy to summarize activities.
1800 Calibrate YSI at hotel.

**~~Plans~~/Future Activities**

Note: PID calibration gas 100 ppm isobutylene
Lot No. LTB213-RR-CM

**Observations/Issues of Concern**

0630 Depart for site.
0700 Arrive on site. Locate all points to be cleared today. Calibrate PID + YSI. PID calibrated to 0 ppm ambient air + 100 ppm isobutylene.
0715 Conduct safety briefing.
0725 Begin drilling DPT0229 again.
0800 Utility locator show up - walk locations to be cleared with them.
0820 Resume work at DPT0229. All boring locations (new + adjusted) cleared.
0955 Complete DPT0229, decon equipment + move to DPT0230 (A6 on map).
1200 Air screening has been at 0.0 ppm since work began. Rig blew hydraulic line - temporarily down while it is fixed.
1255 Resume drilling at DPT0230.
1400 Complete DPT0230, decon equipment + mobe to DPT0228 (AN) to begin grouting
1430 Move to DPT0226 (AM)
1505 Complete DPT0226 + move to DPT0227 (AO).
1535 Complete DPT0227 + decon. Move rig to advance DPT0231 (AI)
1754 Collect last GW sample at DPT0231, decon + calibrate YSI.

**~~Plans/Future Activities~~**

1830 Transfer decon + purge water from day, give last of samples to mobile lab, secure equipment + depart site

**Observations/Issues of Concern**

0700 arrive on site, conduct safety briefing + check w/ NASA (LS) duty ofc. re: Phase I + II weather alerts. On Phase I ~~+ II expected at~~ (CS) until 09:00.
0720 Pull rig off (LS) DPT0235 to grout 0232 + 0233 in woods before weather worsens + they become inaccessible in wetlands area. Calibrate PID + conduct continuing calibration verification on YSI.
0800 Done grouting DPT0232 + move to grout DPT0233.
0835 Done grouting DPT0233 + move to DPT0235 to resume drilling.
1050 Complete DPT0235, decon + move to DPT0234 to grout.
1120 Complete DPT0234 grouting, load equipment to mobe back over by railroad tracks to grout DPT0229 + resume drilling ~~there~~ (LS) area.
1220 DPT0229 grouted + set up to drill DPT0236 (AL on map) moved 13' west of original location to be outside RR tracks.
1510 DPT0236 complete so pull rods from borehole. Phase II weather alert so can't work right now. Check radar + call Lauren.
1530 Send drillers home based on extensive storms on radar + drop samples at mobile lab. Air screened at 0.0 ppm all day.

**~~Plans/Future Activities~~**

1600 Depart site.
1620 Calibrate (CCV) YSI at hotel.

0700 Arrive on site, conduct safety briefing + prep to grout boreholes along RR tracks.
0755 Calibrate YSI + PID (0 ppm + 100 ppm isobutylene)
0840 Load equipment + move to DPT 0237 (AE on map)
0910 Hand augering DPT0237.
1040 Shut down due to phase II weather alert.
1110 Resume working at DPT0237.
1200 Move from DPT0237 to DPT0238 (BA on map). PID 0.0 ppm all morning.
1410 DPT0238 completed + move to DPT0239 (BB on map).
1610 DPT0239 completed + prep to grout. Conduct continuing calibration.
1730 Complete grouting + mobe truck to decon / IDW area. Transfer all purge + decon water remaining to drum.
1740 Collect IDW193P65 sample at pH 7.55. Clean drums (top + sides) + secure pallets w/ straps. Air screened at 0.0 ppm all day.
1800 Drop samples at lab on site. Driller loading equipment.
1830 Depart site.

0700 CT Arrives on site for Utility locate. Meet Rachel Donahue to program coordinates into GPS and mark locations.
0730 GPS indicating that locations are ~200 miles off. Definite problem with GPS. Call Jan Barfus / no answer at TVL office.
0800 Call TVL office. Leave message for Jan or Melissa to call for trouble shooting.
0810 Melissa calls. Says to reset units on GPS from ft. to meters. Guides us through.
0830 Locator Jeff on site. Agrees to return around 1000.
0830 Jan calls. Need to reprogram all coordinates that were programmed before units were changed. Make change, unit now locating Reposed locations accurately
0950 Begin marking locations.
1030 (CT) Call Jill Johnson to discuss issues with DG, CE,

**Plans/Future Activities** (CT)

DPT 0236. DG is in location that has already been drilled (DPT 0195). ~~(CT)~~ CE is due N of DF according to GPS, but looks W according to map. DPT 0236 (already drilled location) is between rails according to GPS. No evidence of drilling here. Believe DPT 0236 was moved and never changed in

**Observations/Issues of Concern**

0645 CT/EDS on site
0700 Health and Safety briefing - traffic safety (vests in parking lot, clear road and cones surrounding rig), Weather warnings, focus and alertness, slips, trips, and falls on wet ground. Utilities
0710 Begin DPT0259 (immediately sample 36-40' interval)
0804 Complete DPT0259
0816 Begin DPT0260 at BV
0828 Called locator Ryan Osterly about clearing locations 25' and 50' S of BJ. He says the locations are clear due to no utilities being located W of railroad tracks. Asked if he needed to sign the dig permit - he says No because they already approved that entire area.
0830 KB Labs picks up samples.
0900 Sensor burned out on Geoprobe. Unable to pull rods.

**Plans/Future Activities** (CT)

Chris calls Geoprobe for troubleshooting.
0945 Chris relays that sensor which allows probe to pull rods on 'fast' speed has gone out. We are still able to pull rods at 'slow' speed but sampling will be significantly slowed down. CT asks him to call EDS and get another probe on site.

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

**Observations/Issues of Concern**

Chris calls EDS. JR able to mobe another probe to site later today. Current probe can (JJ) pull 10-15 samples per day.

0947 Call Lauren Petty (Jill Johnson out of office in AM) and inform of problem. She will call JT and get back to me.

1020 Call Lauren Petty. Says pack probe and supplies after finishing current location. Will reschedule. Heavy rain expected tomorrow and probe issues mean we will not reach sampling goal.

1049 Collect last sample from DPT0260. KB Labs picks up all remaining samples.

1120 CT collects IDW195117 sample/Drillers dumped all decon water/purge water before sample was collected. Note that drum appears slightly less than 80% full (65-70%). New drum has already been started by drillers.

See p.3

**Plans/Future Activities**

— CT checks YSI — Calibration

1125 Drillers grout/top off all remaining open boreholes. CT checks in with railroad maintenance facility office for clearance to cross tracks.

1145 Glenn from KB Labs calls. Has some waste water he needs to dispose of/Drillers load probe/supplies onto trailer.

1155 Glenn on site. Add lab waste water to drum 195117

## Work Performed

Well Installation:
Soil Borings:
DPT: DPT GW Sampling
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

## Observations/Issues of Concern

0630 - Arrive on site, begin YSI calibration
0703 - Begin low flow purging DPT0311-048.0'
0711 - Sample DPT0311-048.0'
0732 - Collect final sample, DPT0311-058.0' Mob to DPT0312 CN/DPT0312
0811 - Collect initial sample, DPT0312-033.0'
0931 - Collect final sample, DPT0312-058.0'. Mob to CN/DPT0313 and then to decon area to dispose of IDW & decon screens
1006 - Collect sample CRHE-IDW197035
1022 - Called Crystal Towns to discuss work rest of day. Drillers will grout open boreholes now. Call Jill (904-591-4076) to discuss rest of day (left message). Will tremie grout BW/DPT0309, CL-DPT0311
1045 - Start grouting locations: AM (308) BX (310) CM (312) surface + BW (309) CL (311) tremie
1145 Phase II called as soon as grouting is completed
1545 Phase II ends. Mob back to CN/DPT0313.

## Plans/Future Activities

1600 Drilling starts at CN/DPT0313. Waiting on confirmation of final depth from Jill Johnson
1614 Collect IDS initial sample of DPT0313-033.0'
1705 Collect sample DPT0313-048.0' and this is the last sample for the week. Surface grouting CN/DPT0313 and demobing
1750 IDW secure for weekend.
1800 off site

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

## Observations/Issues of Concern

0635 - Arrive on site
0640 - Begin calibration of YSI
0650 - EDS begins to demob from AM/0308. Will move to next location, BW/0309.
0700 - EDS begins to grout locations AD (324) & AE (301) (tremie); AF (303), AG (304), AJ (305), AK (306), AL (307) (surface)

0845 - Collect initial sample DPT0309-033.0'.
0918 - Collect sample DPT0309-043.0'. Pull rods & mob to decon area.
1012 - Collect sample DPT0309-048.0'.
1031 - Collect final sample, DPT0309-058.0'. Mob to BX/0310.
1108 - Collect first sample, DPT0310-033.0'. Ben Coppenger arrives on site
1225 - Collect final sample, DPT0310-058.0'. Mob to CL/0311. Break for lunch and to decon rods so that we have 10 clean screens.
1340 - Return from dropping of ~~Rob~~ Mob bringing paperwork and begin to drill at CL/0311
1401 - Collect first sample DPT0311-033.0'
1500 - Phase II called. Stopped right before purging started for DPT0311-048.0'

## Plans/Future Activities

Called Crystal to discuss weather. Will shelter in place and see if phase II passes.
1715 - Lightning observed in area while talking to Crystal Towns about other work, calling work for day. Will resume work at DPT0311-048.0' and
1725 Mob purge extra water ~~from~~ in morning.
1525 - Leave site
1750 - Arrive at TVL office to CCV YSI & drop it off.

Soil Borings:
DPT: DPT GW sampling
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

## Observations/Issues of Concern

0655 - Arrive on-site, discuss with drillers about filling holes that have had grout settle in parking lot (A2 & B2) (DPTs 0294 & 0295)
0700 - Crystal informs that X/296 needs a sample taken from 56-60'
0740 - Contact Crystal about Sp. Cond. calibration. YSI keeps calibrating up to 1,515 instead of 1,413. => Error (mb) was caused by calibrating to Sp. Cond. not conductivity. Issue resolved
0745 - EDS begins to drill to 56-10' at X/296
0800 - Collect DPT0296-058.0 (final sample). Pull rods & move to next location Y/DPT0297
0836 - Collect initial DPT0297-033.0' sample
0853 - Collect DPT0297-038.0' & mob to decon area to decon (drilling mb) equipment
0920 - Decon complete; EDS lays asphalt at locations A2/0294 & B2/0295
1003 - Collect DPT0297-043.0' after decon & asphalt laying
1022 - Collect final sample, DPT0297-048.0'. Move to location Z/0298
1114 - Collect initial sample, DPT0298-033.0'
1212 - Collect DPT0298-048.0' and break for lunch

## Plans/Future Activities

1255 - Back from lunch. Deposit IDW & then mob back to DPT0298
1336 - Collect final sample, DPT0298-058.0'. Move to AA/~~DPT0299~~ mb
1355 - Collect IDW-145130 sample
~~0205~~ (mb) 1405 - Call Crystal. What looks to be a gopher tortoise hole (x2) located ~5ft east of AA. She contacted Becky and instructed to move to next location, AB, until Beck inspects site. Becky performed eco survey in May

note: Crystal = Crystal Towns
Becky = Becky Bolt.

**DAILY FIELD REPORT**

Project: CBHE
Project No.: FR1681
Contractors: EDS

Date: 06/06/14
Task No.: 31#2 (ULR)

## Work Performed

Well Installation:
Soil Borings:
DPT: DPT GW sampling
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

## Observations/Issues of Concern

-1535 Call Crystel. East step-out of S=S-1. Relocate it to southwest of current location, within 25 ft of S/268. AA is best shifted to south. AF is best shifted to southwest. Keep shifting minimal for S-1, AA, and AF. Ace supposed to grout B2/294 & A2/295

-1637 Collect DPT0296-048.0 (final sample). Pull rods & break down location

-1530 Leave site.

MB

Sampling Drums:

**Observations/Issues of Concern**

0655 Arrive on site + calibrate ~~equipment~~ (PS) YSI. Drillers grouting.
0715 Mike Burcham arrives on site. Review SOW with him. Show him lab location at CCF, spill pallets + boring locations in + around woods N of ~~Cont~~ (CS) Contractor's Rd.
0810 Conduct H+S briefing + set up on A2/DPT0295 location.
0820 Attempting to break ground at DPT0295
0928 ~~Hand~~ augering complete + begin drilling.
~~1131 Collect DPT08~~ 0945 Collect initial DPT0295-018.0' sample.
1151 Collect DPT0295-033.0' sample + break for lunch after rods are removed from hole. Anne Chrest + Harry Plaza stop by. Tell her that we are on second angled hole w/slightly slower progress on angled drilling but no problems + all applicable samples collected so far.
1215 Actually depart site for lunch.
1245 On site + resume drilling.
1315 Collect DPT0295-038.0' sample.

**Plans/Future Activities**

1354 Collect final DPT0295-043.0' sample. Pull rods + break down equipment to mobe back across street into woods.
1420 Moving equipment + rig off site.
1515 Drilling began at X/DPT0296
1530 Collect DPT0296-033.0 sample (initial sample at location)

Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums: IDW sample

**Observations/Issues of Concern**

0700 Arrive on site + calibrate YSI. Drillers picking up another spill pallet.
0730 Drillers arrive + conduct H+S briefing. Then set back up to continue at V/DPT0292 location.
0826 Collect final DPT0292-058.0' sample. Move to W/DPT0293.
0912 Collect initial DPT0293-033.0' sample.
1102 Collect final DPT0293-058.0' sample. Break down rig to move back across street to E+ prep for angled drilling. Talk to Gary Osborn who is currently operating Facilities Mgr. + he ok's location + prepared setup area! He indicates that we should set up cones for our safety in the parking lot but that his guys should have access in/out as needed based on what we discussed.
1213 Collect IDW195129 sample. Move rig to Facilities Mgmt. building along w/truck + materials from spill pallet area.
1255 Attempting to break ground at B2/DPT0294.
1330 Complete hand augering through road base w/help of breaker bar + prep to drill to first depth 20' bls = 31' of rod at 40° angle.

**~~Plans/Future Activities~~**

Note: a difference in surface elevation is evident between the east + west sides of the road w/ the woods w/ the ditches in the woods. The variation in elevation appear to range between 2-5' based on viewing w/naked eye. This may result in discrepancies in data for various "depths below surface" if grouped or evaluated together.

Sampling Drums: IDW Sample

**Observations/Issues of Concern**

0655 Arrive on site, conduct H&S briefing + calibrate YSI.
0730 Collect initial DPT0281-028.0' sample.
0745 Jeff + Rylan arrive for utility locate. Stop DPT temporarily to go with them to additional locations at facilities bldg across road to west, in woods + along woods + storm ditch west of woods.
0832 Resume sampling at DPT0281-038.0'. We are clear to drill points AI, AH, AO, AN + AP on 6/5, 6, 12 or 13 but not any other days based on current launch schedule. Check back with locators between 6/9-11 to verify if that schedule is still good. All other points are unaffected by launch activities + are cleared for utilities with the exception of angled drill points which are only "clear" for vertical drilling.
0909 Collect final DPT0281-048.0' sample. Move to BQ/DPT0282.
0939 Collect initial DPT0282-023.0' sample.
1137 Collect final DPT0282-058.0' sample. Move to BP/DPT0283.
1234 Collect initial DPT0283-028.0' sample.

**Plans/Future Activities**

1349 Collect final DPT0283-048.0' sample. Move to BJ/DPT0284.
1425 Collect initial DPT0284-028.0' sample.
1558 Collect IDW195127 sample.
1633 Collect final DPT0284-058.0' sample. Conduct CCV on YSI + prep to decon + grout.
1730 Complete grouting DPT0277-0283. Depart site.

0645- Arrive @ badging office to meet Bear crew. Drill crew is inside getting badges
0710- Conduct initial Tailgate Safety meeting and discuss week ahead
0735- Call KSC Utility (Jeff McDowell) confirm that duty office needs to be called prior to drilling when in/near right of ways, but not in other locations. Rules regarding Critical Days apply to some areas as well
0835- Picked up sample vials from KB Labs. Will do one pickup @ end of day. I will keep samples on ice until lab receives
0855- Do walls of brush w/ Bear EB, DF not drillable due to standing water, FE in heavy brush
0910- Drilling starts @ AA/DPT 0340
0925- No productivity @ 31-35 ft BLS. Drillers getting check valve from vehicle south of work area. Valve was not in trucks. Finished depth by pulling GW available for geochem and then pulling as much GW as possible, using for sample & recirculating to collect more

**Plans/Future Activities**

1136- Complete AA/DPT 0340. Mob to CX/DPT 0341. Drillers mob to IDW area to decon
1140- Contact Lane Drennan, drillers do not have steam pressure washer for decon, just pressure washer. Lane says to have them rent one tomorrow, use regular pressure washer today
1232 Begin drilling at CX/DPT 0341

**Observations/Issues of Concern**

1429 - While inserting poly tubing w/ check valves, tubing would not go past certain point & reach the screen interval. It was unable to be removed. Pulled rods from 55 ft BLS & decommissioned portions that had mushroomed
1446 - Collect sample CRHE-IDW-~~19327~~ MB 198327
1500 - Collect Sample ~~ED~~ MB CRHE-IDW 198328
1305 - Drilling restarts @ EC/DPT0357
1545 - Complete EC/DPT0357. Talk w/ Lane. Done @ CRHE w/ drilling activities. Grout open locations & manage IDW. Tremie locations sampled today & EH. Can pour ED & EF. Will go w/ Brian to help w/ grout while Chris manages IDW
1626 - Phase II called while grouting ED. EH grouted via tremie prior to phase II. Weather says phase II should end by 1800 at the latest (as of 1650)
1745 - Contact Zone. Weather getting bad in wooded area, leave before grouting location & rob to decon area to manage IDW when phase II lifted
MB ~~06~~ 1845 - Phase II terminated. Manage IDW
1905 - Leave site

**Observations/Issues of Concern**

0645 - Arrive on site. Bear at decon area already. Begin YSI cal.
0706 - Mob to work area & finish cal there
0710 - Call Duty Officer to inform of drilling, next straight to voice mail. Will call back
0735 - Approx. 6"-8" standing water at drill location EG/DPT0355. Call Lane to discuss. Will pull rods, grout immediately via tremmie & move to EA/DPT0356 which is not located in standing water. Mob to get grout supplies
0815 - Grout supplies back at location. Begin to mob pull rods & grout
0825 - EG/DPT0355 grouted. Mob to EA/DPT0356
0830 - Drilling starts @ EA/DPT0356
1105 - Drilling complete @ EA/DPT0356. Will go check out area around BE while Chris mobs rig out of here to see if it is accessible following heavy rain yesterday
1115 - During visit to BE, Lane contacts me & informs that NASA RPM would like us to finish EG, mob back to EG
1136 - Call Lane, grout from earlier is fluid @ area around EG, and worried it will flow into drilling location. Call Jeff McDowell to see if we can move to a higher location, which is closer to utility (only one marked, line visible). Jeff says there are four utilities in right of way we are drilling in & can be out in in hour to locate.
1150 - Call Lane and tell him about utilities. Decides that we should move to EC/DPT0357. Begin mob ~~to~~ mb to location
1230 - Begin to hand auger. Run into rocky layer ~2ft. Use macro core ~~the~~ mb to move past impermeable layer, hand auger to 5ft BLS

Date: 4/29/14
Task No.: 36*1

**Work Performed**

Well Installation:
Soil Borings:
DPT: Groundwater Sampling
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

**Observations/Issues of Concern**

0650 - Arrive on site. Bear on site already. Calibrate YST while Bear preps to mob to wells

0730 - Begin mob to wells. Will go ahead to see if access road is possible for support vehicle. If not, will leave support vehicle in dry part of creek road, but that will make mobing for Bear more time consuming

0840 - Set up @ EH/DPT0353. Scoped out location EE on way to EH, new location under ~2" standing water. Relayed info to Lane Dorman. Also looked for debris mentioned in email + couldn't find it. Confirmed w/ Lane that we will skip collecting a sample @ 51-55 ft BLS

0945 - Screen broken as rods being pulled, on top portion unthreaded to other rods retrieved. Screen + casing unretrievable

1131 - Complete EH/DPT0353. Mob to finish EF/DPT0343.

1301 - Complete EF/DPT0343. Mob to ED/DPT0354. GPS DPT0353 in process

1315 ~~1305~~ - Begin drilling at ED/DPT0354.

1435 - Brian (Bear) rods while Chris MB ~~goes~~ goes to Bear screens

1606 - Finish ED/DPT0354. Mob to EG/DPT0355

**Plans/Future Activities**

1610 - Call duty office since EG/DPT0355 is in right of MB ~~west~~ way. OK to drill.

1630 - Drilling begins @ EG/DPT0355

1647 - Collect sample @ EG/DPT0355 from 31-35 ft BLS. Tells to Lane, Weather is moving in. Will leave rods in ground + mob to Bear area to handle IDW

1720 - Finish IDW + Bear pit management, Phase II walked.

1730 - Leave site

Sampling Hazardous Waste:
Sampling Drums:

**Observations/Issues of Concern**

0650- Arrive on site, same time as Bear
0700 - Call KSC Duty office regarding drilling on/near right of ways. OK to drill
0702 - Begin YSI cal
0750 - Begin drilling at CG/DPT0350. Unable to hand auger to 5 ft BLS, obstruction reached ~ 0.5 ft BLS (appears to be thick rock layer from soil coal). Use DPT rig to push through layer and then hand auger to 5 ftBLS.
0930 - KSC Utility on site. Remarks utilities around BN + approves alternate location to west incase BN cannot be drilled
1050 - Location CG/DPT0350 complete. Mob to BN/DPT0351
1102 - Jill contacts me to get Kevin to call her. Talk to Lane about drillers not work
1115 - Drillers able to set up at original BN location. Unable to hand auger initial 1 ft. Use bit and then hand auger to 5 ft BLS
1155 - Kevin leaves to meet Jeam company @ lodging office to collect NASA approved drums
1340 - Complete BN/DPT0351. Mob to CE/DPT0352 following discussion w/ Lane.
1400 - Drillers unable to hand auger past ~1 ft BLS. Use drill bit to push through depth + then hand augered to 5 ftBLS

**Plans/Future Activities**

1625 - Complete CE/DPT0352. Call Lane, does not want us to start another location since it would be open over weekend. Mob to manage IDW
1755 - IDW in drums. Sample CRHC-IDW 198326 collected
1800 - off site

**Observations/Issues of Concern**

and will collect sample, and then mob DPT rig back to down area for access tomorrow

~~0640~~ - 1740 - Collect 048.0 @ EF/0343. Pull rods & mob DPT rig back so MOT can start work first thing Wed. AM. Get car stuck during mob. Joe Bartlett gives me NASA paper

1840 - Dispose of IDW

1845 - Hand samples off to KB Labs. Off site for day

**Plans/Future Activities**

9/23/14
Signature/Date

Geosyntec consultants

**DAILY FIELD REPORT**

Project: CRHE
Project No.: FR1681
Contractors: Bear Env.

Date: 9/23/14
Task No.: 36*1

## Work Performed

Well Installation:
Soil Borings:
DPT: Groundwater Sampling
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

## Observations/Issues of Concern

0630 - Arrive on site. Begin YSI calibration
0645 - Bear arrives on site w/ power steam cleaner as discussed yesterday
0715 - Dispose of IDW from yesterday while Kevin (Bear) goes to other Bear site for tubing
0800 - Mob back to woods & begin to pull screen on CX/DPT0341 @ 57-60 ft BLS
0812 - Sampling complete @ CX/DPT0341. Mob to CT/DPT0342
0815 - Lane Dorman calls. Reminds me that reverse flow is not mandatory per FL SOP & to use regular flow if it will be faster
0825 - Begin drilling @ CT/DPT0342
0930 - Phase II, Tie mob to Levan area
0940 - Phase II terminated, but back @ Levan area to Levan screens
1005 - Mobilize back to woods following Levan & restart drilling to 46-50 ft BLS @ CT
1101 - CT/DPT0342 Complete. Mob to EF/DPT0343
1245 - Phase II issued. Mob to Levan area to dispose of IDW when it's over
1305 - Phase II over. Dispose of IDW
1320 - Mob back to woods
1330 - Phase II called upon return to site

## Plans/Future Activities

1530 - Call MB Lane Dorman and discuss plan for day if Phase II lifted. Finish EF, mob out of woods & try to drill location in rail road area
1605 - Phase II lifted. Return to try and sample EF/343 @ 45-50, 55-60 ft BLS
1640 - End of tubing caught & GW not flowing @ 46-50' BLS. Pull rods, remove tubing & push back to depth
1655 - Phase II called. Sample not yet collected. Talked to Lane Dorman

**DAILY FIELD REPORT**

Project: CRHE
Project No.: FR1681
Contractors: Bear

Date: 9/22/14
Task No.: 36*1

**Work Performed**

Well Installation:
Soil Borings:
DPT: Groundwater Sampling
Well Inventory:
Other:

Sampling Soil:
Sampling SW/Sediment:
Sampling Monitor Wells:
Sampling Hazardous Waste:
Sampling Drums:

**Observations/Issues of Concern**

1358 - Lane informs that 51-55 ft BLS should be collected @ CX/DPT0341

1505 - Phase II, stop delay @ CX/DPT0341. Rods @ 60 ft BLS. Talk to Lane, informs that 31-35 ft BLS should be collected @ all locations + 41-45 + 46-50 @ BE + BF, 36-40 + 46-50 @ AY. Also to place IDW in Drum 197036 first during disposal

1600 - Talk to Lane, weather does not appear to be relenting, call it for the day. Will drop off samples w/ KB labs. Meet Bear back here tomorrow between 0630 + 0645. They will pick up + steam cleaner tomorrow

1615 - Samples handed off to lab.

1630 - Off site.

CAL - Initial Calibration
ICV - Initial Calibration Verification
CCV - Continuing Calibration Verification

Comments:

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration
Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)
Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7, add a third calibration point if needed (i.e. pH > 7)
If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7, add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Comments: DO & Specific Conductance Failed CCV

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

Comments: Specific Conductance Failed CCV

1. See Table FS 2200-2 on the back of this form

Comments:

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

Comments:

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings: always start with pH 7, add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Comments:

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

Specific Conductance Probe Cleaned? Yes No  Disolved Oxygen membrane Changed? Yes No

CAL - Initial Calibration
ICV - Initial Calibration Verification
CCV - Continuing Calibration Verification

Comments:

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration
Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)
Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

Comments:

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

Specific Conductance Probe Cleaned? Yes (No)  Disolved Oxygen membrane Changed? Yes (No)

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Comments: _____

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings - always start with pH 7 and a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append a sample results with a "J" qualifier

CCV - Continuing Calibration Verification
Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration
Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)
Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7, add a third calibration point if needed (i.e. pH > 7)
If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

Comments: combined CCV & CAL @ one time. Knew when completed ccv on 3/29/13 it would be w/i 24 hours

all parameters passed CAL. pH & ORP failed CCV.

1 - See Table FS 2200-2 on the back of this form

ICAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (i.e., if readings are in the 400's a 447 mS/cm standard or 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings (i.e., start with pH 7 and add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria, then append sample results with an 'J' qualifier

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration
ICV - Initial Calibration Verification
CCV - Continuing Calibration Verification

Comments:

Allow adequate time for the dissolved oxygen sensor to equilibrate during all calibration
Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)
Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings. Always start with pH 7 and a third calibration point if needed (i.e. pH > 7)
If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Comments:

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings always start with pH 7 add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration
Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)
Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings always start with pH 7, add a third calibration point if needed (i.e. pH > 7)
If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

Comments: * Initial reading + Cal values for pH: 4.0 - 3.84/4.00
7.0 - 7.13/7.80  10.0 - 9.95/9.99
Specific Conductance was initially calibrated incorrectly. See field notes.

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings. always start with pH 7, add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings < 0.1 mS/cm then one standard of 0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings always start with pH 7, add a third calibration point if needed (i.e. pH > 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

Notes:

CAL = Initial Calibration
ICV = Initial Calibration Verification
CCV = Continuing Calibration Verification
* See Table FS 2200-2 on the back of this form

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration
Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings <0.1 mS/cm is acceptable)
Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if neede
If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

Notes:
DPT = Direct Push Technology
ft BLS = feet below land surface
mS/cm = milliSiemens per centimeter (or millimhos per centimeter)
NTU = Nephelometric Turbidity Units

DO (mg/L) = Dissolved Oxygen (milligrams per liter)
Temp (°C) = Temperature (degrees Celsius)
TDS (g/L) = Total Dissolved Solids (grams per liter)
ORP (mV) = Oxidation Reduction Potential (milliVolts)

DPT = Direct Push Technology

ft BLS = feet below land surface

mS/cm = milliSiemens per centimeter (or millimhos per centimeter)

NTU = Nephelometric Turbidity Units

DO (mg/L) = Dissolved Oxygen (milligrams per liter)

Temp (°C) = Temperature (degrees Celsius)

TDS (g/L) = Total Dissolved Solids (grams per liter)

ORP (mV) = Oxidation Reduction Potential (milliVolts)
